GR NAME GR DESCRIPTION

======== ==========

GR7401 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7401(GR7401) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7401 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7401 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7401 precursor DNA encodes GR7401 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7401 is located from position 40374392 to position 40374501 relative to chromosome chr17 on the `-` strand (chr is an abbreviation for chromosome).

GR7401 precursor RNA folds spatially, forming GR7401 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7401 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7401 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7401 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336725 precursor RNA and GAM336726 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336725 RNA and GAM336726 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336725 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336725 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336725 target RNA into GAM336725 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336726 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336726 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336726 target RNA into GAM336726 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7401 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7401 polynucleotide: GAM336725 target protein and GAM336726 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336725 and GAM336726

GR7402 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7402(GR7402) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7402 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7402 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7402 precursor DNA encodes GR7402 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7402 is located from position 79828330 to position 79828455 relative to chromosome chr14 on the `-` strand (chr is an abbreviation for chromosome).

GR7402 precursor RNA folds spatially, forming GR7402 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7402 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7402 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7402 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2807 precursor RNA and GAM4147 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2807 RNA and GAM4147 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM2807 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM2807 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2807 target RNA into GAM2807 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM4147 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM4147 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM4147 target RNA into GAM4147 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7402 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7402 polynucleotide: GAM2807 target protein and GAM4147 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM2807 and GAM4147

GR7403 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7403(GR7403) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7403 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7403 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7403 precursor DNA encodes GR7403 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7403 is located from position 25868146 to position 25868249 relative to chromosome chr21 on the `+` strand (chr is an abbreviation for chromosome).

GR7403 precursor RNA folds spatially, forming GR7403 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7403 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7403 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7403 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2543 precursor RNA and GAM4738 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2543 RNA and GAM4738 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM2543 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM2543 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2543 target RNA into GAM2543 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM4738 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM4738 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM4738 target RNA into GAM4738 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7403 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7403 polynucleotide: GAM2543 target protein and GAM4738 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM2543 and GAM4738

GR7404 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7404(GR7404) polynucleotide, which encodes an `operon-like` cluster of novel

micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7404 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7404 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7404 precursor DNA encodes GR7404 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7404 is located from position 3260143 to position 3260219 relative to chromosome chr7 on the `-` strand (chr is an abbreviation for chromosome).

GR7404 precursor RNA folds spatially, forming GR7404 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7404 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7404 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7404 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM7530 precursor RNA and GAM7933 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM7530 RNA and GAM7933 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM7530 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM7530 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM7530 target RNA into GAM7530 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM7933 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM7933 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.

8, thereby inhibiting translation of GAM7933 target RNA into GAM7933 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7404 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7404 polynucleotide: GAM7530 target protein and GAM7933 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM7530 and GAM7933

GR7405 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7405(GR7405) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7405 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7405 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7405 precursor DNA encodes GR7405 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7405 is located from position 131248823 to position 131249168 relative to chromosome chrX on the `-` strand (chr is an abbreviation for chromosome).

GR7405 precursor RNA folds spatially, forming GR7405 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7405 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7405 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7405 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2608 precursor RNA and GAM3298 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2608 RNA and GAM3298 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig.

8.

GAM2608 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM2608 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2608 target RNA into GAM2608 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM3298 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM3298 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM3298 target RNA into GAM3298 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7405 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7405 polynucleotide: GAM2608 target protein and GAM3298 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM2608 and GAM3298

GR7407 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7407(GR7407) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7407 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7407 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7407 precursor DNA encodes GR7407 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7407 is located from position 39394031 to position 39394119 relative to chromosome chr1 on the `+` strand (chr is an abbreviation for chromosome).

GR7407 precursor RNA folds spatially, forming GR7407 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7407 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7407 precursor RNA comprises a plurality of segments,

the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7407 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336704 precursor RNA and GAM336705 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336704 RNA and GAM336705 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336704 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336704 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336704 target RNA into GAM336704 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336705 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336705 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336705 target RNA into GAM336705 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7407 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7407 polynucleotide: GAM336704 target protein and GAM336705 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336704 and GAM336705

GR7408 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7408(GR7408) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7408 precursor DNA, herein designated GR PRECURSOR DNA, is a novel

bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7408 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7408 precursor DNA encodes GR7408 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7408 is located from position 158626687 to position 158626807 relative to chromosome chr1 on the `+` strand (chr is an abbreviation for chromosome).

GR7408 precursor RNA folds spatially, forming GR7408 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7408 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7408 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7408 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM4561 precursor RNA and GAM8285 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM4561 RNA and GAM8285 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM4561 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM4561 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM4561 target RNA into GAM4561 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM8285 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM8285 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM8285 target RNA into GAM8285 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities,

of GR7408 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7408 polynucleotide: GAM4561 target protein and GAM8285 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM4561 and GAM8285

GR7409 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7409(GR7409) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7409 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7409 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7409 precursor DNA encodes GR7409 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7409 is located from position 12778141 to position 12778255 relative to chromosome chr10 on the `+` strand (chr is an abbreviation for chromosome).

GR7409 precursor RNA folds spatially, forming GR7409 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7409 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7409 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7409 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336388 precursor RNA and GAM336389 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336388 RNA and GAM336389 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336388 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336388 target RNA, herein schematically represented by

GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336388 target RNA into GAM336388 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336389 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336389 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336389 target RNA into GAM336389 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7409 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7409 polynucleotide: GAM336388 target protein and GAM336389 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336388 and GAM336389

GR7410 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7410(GR7410) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7410 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7410 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7410 precursor DNA encodes GR7410 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7410 is located from position 70411479 to position 70411571 relative to chromosome chr10 on the `+` strand (chr is an abbreviation for chromosome).

GR7410 precursor RNA folds spatially, forming GR7410 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7410 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7410 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7410 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA,

is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337083 precursor RNA and GAM337084 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337083 RNA and GAM337084 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337083 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337083 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337083 target RNA into GAM337083 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337084 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337084 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337084 target RNA into GAM337084 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7410 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7410 polynucleotide: GAM337083 target protein and GAM337084 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337083 and GAM337084

GR7411 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7411(GR7411) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7411 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7411 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7411 precursor DNA encodes GR7411 precursor RNA, herein designated GR

PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7411 is located from position 101743922 to position 101744005 relative to chromosome chr10 on the `+` strand (chr is an abbreviation for chromosome).

GR7411 precursor RNA folds spatially, forming GR7411 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7411 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7411 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7411 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM892 precursor RNA and GAM5886 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM892 RNA and GAM5886 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM892 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM892 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM892 target RNA into GAM892 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM5886 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM5886 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM5886 target RNA into GAM5886 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7411 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7411 polynucleotide: GAM892 target protein and GAM5886 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with

references to GAM892 and GAM5886

GR7412 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7412(GR7412) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7412 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7412 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7412 precursor DNA encodes GR7412 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7412 is located from position 121833616 to position 121833747 relative to chromosome chr10 on the `+` strand (chr is an abbreviation for chromosome).

GR7412 precursor RNA folds spatially, forming GR7412 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7412 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7412 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7412 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM367 precursor RNA and GAM6807 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM367 RNA and GAM6807 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM367 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM367 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM367 target RNA into GAM367 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM6807 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM6807 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM6807 target RNA into GAM6807 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7412 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7412 polynucleotide: GAM367 target protein and GAM6807 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM367 and GAM6807

GR7413 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7413(GR7413) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7413 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7413 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7413 precursor DNA encodes GR7413 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7413 is located from position 15010865 to position 15010960 relative to chromosome chr10 on the `-` strand (chr is an abbreviation for chromosome).

GR7413 precursor RNA folds spatially, forming GR7413 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7413 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7413 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7413 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM336407 precursor RNA, GAM336408 precursor RNA and GAM336409 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of

Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336407 RNA, GAM336408 RNA and GAM336409 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336407 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336407 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336407 target RNA into GAM336407 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336408 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336408 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336408 target RNA into GAM336408 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336409 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336409 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336409 target RNA into GAM336409 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7413 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7413 polynucleotide: GAM336407 target protein, GAM336408 target protein and GAM336409 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336407, GAM336408 and GAM336409

GR7414 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7414(GR7414) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7414 precursor DNA, herein designated GR PRECURSOR DNA, is a novel

bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7414 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7414 precursor DNA encodes GR7414 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7414 is located from position 22440215 to position 22440312 relative to chromosome chr10 on the `-` strand (chr is an abbreviation for chromosome).

GR7414 precursor RNA folds spatially, forming GR7414 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7414 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7414 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7414 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336507 precursor RNA and GAM336508 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336507 RNA and GAM336508 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336507 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336507 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336507 target RNA into GAM336507 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336508 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336508 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336508 target RNA into GAM336508 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities,

of GR7414 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7414 polynucleotide: GAM336507 target protein and GAM336508 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336507 and GAM336508

GR7415 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7415(GR7415) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7415 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7415 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7415 precursor DNA encodes GR7415 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7415 is located from position 93938738 to position 93938849 relative to chromosome chr10 on the `-` strand (chr is an abbreviation for chromosome).

GR7415 precursor RNA folds spatially, forming GR7415 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7415 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7415 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7415 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1914 precursor RNA and GAM3271 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1914 RNA and GAM3271 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM1914 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM1914 target RNA, herein schematically represented by GAM1 TARGET RNA

through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1914 target RNA into GAM1914 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM3271 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM3271 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM3271 target RNA into GAM3271 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7415 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7415 polynucleotide: GAM1914 target protein and GAM3271 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM1914 and GAM3271

GR7416 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7416(GR7416) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7416 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7416 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7416 precursor DNA encodes GR7416 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7416 is located from position 94365822 to position 94365930 relative to chromosome chr10 on the `-` strand (chr is an abbreviation for chromosome).

GR7416 precursor RNA folds spatially, forming GR7416 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7416 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7416 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7416 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA,

is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337270 precursor RNA and GAM337271 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337270 RNA and GAM337271 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337270 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337270 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337270 target RNA into GAM337270 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337271 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337271 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337271 target RNA into GAM337271 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7416 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7416 polynucleotide: GAM337270 target protein and GAM337271 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337270 and GAM337271

GR7417 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7417(GR7417) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7417 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7417 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7417 precursor DNA encodes GR7417 precursor RNA, herein designated GR

PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7417 is located from position 102859212 to position 102859318 relative to chromosome chr10 on the `-` strand (chr is an abbreviation for chromosome).

GR7417 precursor RNA folds spatially, forming GR7417 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7417 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7417 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7417 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1523 precursor RNA and GAM7654 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1523 RNA and GAM7654 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM1523 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM1523 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1523 target RNA into GAM1523 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM7654 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM7654 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM7654 target RNA into GAM7654 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7417 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7417 polynucleotide: GAM1523 target protein and GAM7654 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with

references to GAM1523 and GAM7654

GR7418 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7418(GR7418) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7418 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7418 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7418 precursor DNA encodes GR7418 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7418 is located from position 105033873 to position 105033967 relative to chromosome chr10 on the `-` strand (chr is an abbreviation for chromosome).

GR7418 precursor RNA folds spatially, forming GR7418 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7418 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7418 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7418 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337377 precursor RNA and GAM337378 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337377 RNA and GAM337378 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337377 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337377 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337377 target RNA into GAM337377 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337378 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337378 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337378 target RNA into GAM337378 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7418 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7418 polynucleotide: GAM337377 target protein and GAM337378 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337377 and GAM337378

GR7419 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7419(GR7419) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7419 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7419 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7419 precursor DNA encodes GR7419 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7419 is located from position 105533378 to position 105533458 relative to chromosome chr10 on the `-` strand (chr is an abbreviation for chromosome).

GR7419 precursor RNA folds spatially, forming GR7419 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7419 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7419 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7419 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1087 precursor RNA and GAM8693 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1087 RNA and GAM8693 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM1087 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM1087 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1087 target RNA into GAM1087 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM8693 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM8693 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM8693 target RNA into GAM8693 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7419 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7419 polynucleotide: GAM1087 target protein and GAM8693 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM1087 and GAM8693

GR7420 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7420(GR7420) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7420 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7420 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7420 precursor DNA encodes GR7420 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7420 is located from position 48222373 to position 48222452 relative to chromosome chr11 on the `+` strand (chr is an abbreviation for chromosome).

GR7420 precursor RNA folds spatially, forming GR7420 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7420 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7420 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7420 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM44 precursor RNA and GAM83 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM44 RNA and GAM83 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM44 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM44 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM44 target RNA into GAM44 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM83 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM83 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM83 target RNA into GAM83 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7420 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7420 polynucleotide: GAM44 target protein and GAM83 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM44 and GAM83

GR7421 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7421(GR7421) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at

least one target gene, the function and utility of which at least one target gene is known in the art.

GR7421 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7421 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7421 precursor DNA encodes GR7421 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7421 is located from position 65732677 to position 65732778 relative to chromosome chr11 on the `+` strand (chr is an abbreviation for chromosome).

GR7421 precursor RNA folds spatially, forming GR7421 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7421 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7421 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7421 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337020 precursor RNA and GAM337021 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337020 RNA and GAM337021 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337020 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337020 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337020 target RNA into GAM337020 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337021 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337021 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337021 target RNA into GAM337021

target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7421 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7421 polynucleotide: GAM337020 target protein and GAM337021 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337020 and GAM337021

GR7422 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7422(GR7422) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7422 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7422 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7422 precursor DNA encodes GR7422 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7422 is located from position 92812990 to position 92813083 relative to chromosome chr11 on the `+` strand (chr is an abbreviation for chromosome).

GR7422 precursor RNA folds spatially, forming GR7422 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7422 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7422 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7422 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1860 precursor RNA and GAM7601 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1860 RNA and GAM7601 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM1860 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM1860 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1860 target RNA into GAM1860 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM7601 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM7601 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM7601 target RNA into GAM7601 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7422 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7422 polynucleotide: GAM1860 target protein and GAM7601 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM1860 and GAM7601

GR7423 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7423(GR7423) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7423 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7423 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7423 precursor DNA encodes GR7423 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7423 is located from position 113128395 to position 113128479 relative to chromosome chr11 on the `+` strand (chr is an abbreviation for chromosome).

GR7423 precursor RNA folds spatially, forming GR7423 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7423 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7423 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at

least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7423 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM337441 precursor RNA, GAM337442 precursor RNA and GAM337443 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337441 RNA, GAM337442 RNA and GAM337443 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337441 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337441 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337441 target RNA into GAM337441 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337442 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337442 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337442 target RNA into GAM337442 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337443 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337443 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337443 target RNA into GAM337443 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7423 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7423 polynucleotide: GAM337441 target protein, GAM337442 target protein and GAM337443 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337441, GAM337442 and GAM337443

GR7424 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7424(GR7424) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7424 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7424 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7424 precursor DNA encodes GR7424 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7424 is located from position 2928734 to position 2928845 relative to chromosome chr11 on the `-` strand (chr is an abbreviation for chromosome).

GR7424 precursor RNA folds spatially, forming GR7424 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7424 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7424 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7424 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336265 precursor RNA and GAM336266 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336265 RNA and GAM336266 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336265 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336265 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336265 target RNA into GAM336265 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336266 RNA, herein schematically represented by GAM1 RNA through

GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336266 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336266 target RNA into GAM336266 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7424 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7424 polynucleotide: GAM336265 target protein and GAM336266 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336265 and GAM336266

GR7425 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7425(GR7425) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7425 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7425 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7425 precursor DNA encodes GR7425 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7425 is located from position 45420363 to position 45420459 relative to chromosome chr11 on the `-` strand (chr is an abbreviation for chromosome).

GR7425 precursor RNA folds spatially, forming GR7425 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7425 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7425 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7425 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM588 precursor RNA and GAM1440 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM588 RNA and GAM1440 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM588 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM588 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM588 target RNA into GAM588 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM1440 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM1440 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1440 target RNA into GAM1440 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7425 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7425 polynucleotide: GAM588 target protein and GAM1440 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM588 and GAM1440

GR7426 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7426(GR7426) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7426 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7426 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7426 precursor DNA encodes GR7426 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7426 is located from position 46157389 to position 46157488 relative to chromosome chr11 on the `-` strand (chr is an abbreviation for chromosome).

GR7426 precursor RNA folds spatially, forming GR7426 folded precursor

RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7426 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7426 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7426 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336802 precursor RNA and GAM336803 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336802 RNA and GAM336803 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336802 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336802 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336802 target RNA into GAM336802 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336803 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336803 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336803 target RNA into GAM336803 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7426 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7426 polynucleotide: GAM336802 target protein and GAM336803 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336802 and GAM336803

GR7427 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7427(GR7427) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at

least one target gene, the function and utility of which at least one target gene is known in the art.

GR7427 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7427 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7427 precursor DNA encodes GR7427 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7427 is located from position 62724055 to position 62725651 relative to chromosome chr11 on the `-` strand (chr is an abbreviation for chromosome).

GR7427 precursor RNA folds spatially, forming GR7427 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7427 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7427 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7427 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336973 precursor RNA and GAM336974 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336973 RNA and GAM336974 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336973 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336973 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336973 target RNA into GAM336973 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336974 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336974 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336974 target RNA into GAM336974

target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7427 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7427 polynucleotide: GAM336973 target protein and GAM336974 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336973 and GAM336974

GR7428 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7428(GR7428) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7428 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7428 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7428 precursor DNA encodes GR7428 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7428 is located from position 69517026 to position 69517124 relative to chromosome chr11 on the `-` strand (chr is an abbreviation for chromosome).

GR7428 precursor RNA folds spatially, forming GR7428 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7428 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7428 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7428 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2887 precursor RNA and GAM6083 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2887 RNA and GAM6083 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM2887 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM2887 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2887 target RNA into GAM2887 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM6083 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM6083 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM6083 target RNA into GAM6083 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7428 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7428 polynucleotide: GAM2887 target protein and GAM6083 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM2887 and GAM6083

GR7429 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7429(GR7429) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7429 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7429 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7429 precursor DNA encodes GR7429 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7429 is located from position 72624650 to position 72624756 relative to chromosome chr11 on the `-` strand (chr is an abbreviation for chromosome).

GR7429 precursor RNA folds spatially, forming GR7429 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7429 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7429 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at

least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7429 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337116 precursor RNA and GAM337117 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337116 RNA and GAM337117 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337116 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337116 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337116 target RNA into GAM337116 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337117 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337117 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337117 target RNA into GAM337117 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7429 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7429 polynucleotide: GAM337116 target protein and GAM337117 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337116 and GAM337117

GR7430 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7430(GR7430) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7430 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The

method by which GR7430 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7430 precursor DNA encodes GR7430 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7430 is located from position 78654885 to position 78654989 relative to chromosome chr11 on the `-` strand (chr is an abbreviation for chromosome).

GR7430 precursor RNA folds spatially, forming GR7430 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7430 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7430 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7430 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM3630 precursor RNA and GAM7264 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM3630 RNA and GAM7264 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM3630 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM3630 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM3630 target RNA into GAM3630 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM7264 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM7264 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM7264 target RNA into GAM7264 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7430 polynucleotide correlate with, and may be deduced from, the identity of

the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7430 polynucleotide: GAM3630 target protein and GAM7264 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM3630 and GAM7264

GR7431 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7431(GR7431) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7431 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7431 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7431 precursor DNA encodes GR7431 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7431 is located from position 96304357 to position 96304458 relative to chromosome chr11 on the `-` strand (chr is an abbreviation for chromosome).

GR7431 precursor RNA folds spatially, forming GR7431 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7431 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7431 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7431 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM5292 precursor RNA and GAM7777 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM5292 RNA and GAM7777 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM5292 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM5292 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM5292 target RNA into GAM5292 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM7777 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM7777 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM7777 target RNA into GAM7777 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7431 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7431 polynucleotide: GAM5292 target protein and GAM7777 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM5292 and GAM7777

GR7432 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7432(GR7432) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7432 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7432 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7432 precursor DNA encodes GR7432 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7432 is located from position 116689623 to position 116689733 relative to chromosome chr11 on the `-` strand (chr is an abbreviation for chromosome).

GR7432 precursor RNA folds spatially, forming GR7432 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7432 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7432 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7432 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate

GAM precursor RNAs, GAM337458 precursor RNA and GAM337459 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337458 RNA and GAM337459 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337458 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337458 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337458 target RNA into GAM337458 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337459 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337459 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337459 target RNA into GAM337459 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7432 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7432 polynucleotide: GAM337458 target protein and GAM337459 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337458 and GAM337459

GR7433 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7433(GR7433) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7433 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7433 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7433 precursor DNA encodes GR7433 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand

nucleotides long. Nucleotide sequence of GR7433 is located from position 129765258 to position 129765349 relative to chromosome chr11 on the `-` strand (chr is an abbreviation for chromosome).

GR7433 precursor RNA folds spatially, forming GR7433 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7433 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7433 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7433 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2767 precursor RNA and GAM3712 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2767 RNA and GAM3712 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM2767 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM2767 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2767 target RNA into GAM2767 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM3712 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM3712 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM3712 target RNA into GAM3712 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7433 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7433 polynucleotide: GAM2767 target protein and GAM3712 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM2767 and GAM3712

GR7434 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7434(GR7434) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7434 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7434 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7434 precursor DNA encodes GR7434 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7434 is located from position 46553863 to position 46553950 relative to chromosome chr12 on the `+` strand (chr is an abbreviation for chromosome).

GR7434 precursor RNA folds spatially, forming GR7434 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7434 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7434 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7434 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM270 precursor RNA and GAM965 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM270 RNA and GAM965 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM270 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM270 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM270 target RNA into GAM270 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM965 RNA, herein schematically represented by GAM1 RNA through GAM3

RNA, binds complementarily to a target binding site located in an untranslated region of GAM965 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM965 target RNA into GAM965 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7434 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7434 polynucleotide: GAM270 target protein and GAM965 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM270 and GAM965

GR7435 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7435(GR7435) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7435 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7435 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7435 precursor DNA encodes GR7435 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7435 is located from position 53823632 to position 53823727 relative to chromosome chr12 on the `-` strand (chr is an abbreviation for chromosome).

GR7435 precursor RNA folds spatially, forming GR7435 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7435 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7435 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7435 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336892 precursor RNA and GAM336893 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336892 RNA and GAM336893 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336892 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336892 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336892 target RNA into GAM336892 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336893 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336893 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336893 target RNA into GAM336893 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7435 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7435 polynucleotide: GAM336892 target protein and GAM336893 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336892 and GAM336893

GR7436 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7436(GR7436) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7436 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7436 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7436 precursor DNA encodes GR7436 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7436 is located from position 56320934 to position 56321065 relative to chromosome chr12 on the `-` strand (chr is an abbreviation for chromosome).

GR7436 precursor RNA folds spatially, forming GR7436 folded precursor

RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7436 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7436 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7436 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM5868 precursor RNA and GAM6799 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM5868 RNA and GAM6799 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM5868 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM5868 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM5868 target RNA into GAM5868 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM6799 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM6799 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM6799 target RNA into GAM6799 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7436 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7436 polynucleotide: GAM5868 target protein and GAM6799 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM5868 and GAM6799

GR7437 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7437(GR7437) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at

least one target gene, the function and utility of which at least one target gene is known in the art.

GR7437 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7437 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7437 precursor DNA encodes GR7437 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7437 is located from position 56423119 to position 56423221 relative to chromosome chr12 on the `-` strand (chr is an abbreviation for chromosome).

GR7437 precursor RNA folds spatially, forming GR7437 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7437 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7437 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7437 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336906 precursor RNA and GAM336907 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336906 RNA and GAM336907 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336906 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336906 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336906 target RNA into GAM336906 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336907 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336907 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336907 target RNA into GAM336907

target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7437 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7437 polynucleotide: GAM336906 target protein and GAM336907 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336906 and GAM336907

GR7438 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7438(GR7438) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7438 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7438 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7438 precursor DNA encodes GR7438 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7438 is located from position 56453734 to position 56453831 relative to chromosome chr12 on the `-` strand (chr is an abbreviation for chromosome).

GR7438 precursor RNA folds spatially, forming GR7438 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7438 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7438 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7438 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1293 precursor RNA and GAM6306 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1293 RNA and GAM6306 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM1293 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM1293 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1293 target RNA into GAM1293 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM6306 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM6306 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM6306 target RNA into GAM6306 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7438 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7438 polynucleotide: GAM1293 target protein and GAM6306 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM1293 and GAM6306

GR7439 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7439(GR7439) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7439 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7439 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7439 precursor DNA encodes GR7439 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7439 is located from position 56716065 to position 56716147 relative to chromosome chr12 on the `-` strand (chr is an abbreviation for chromosome).

GR7439 precursor RNA folds spatially, forming GR7439 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7439 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7439 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at

least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7439 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336913 precursor RNA and GAM336914 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336913 RNA and GAM336914 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336913 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336913 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336913 target RNA into GAM336913 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336914 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336914 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336914 target RNA into GAM336914 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7439 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7439 polynucleotide: GAM336913 target protein and GAM336914 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336913 and GAM336914

GR7440 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7440(GR7440) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7440 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The

method by which GR7440 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7440 precursor DNA encodes GR7440 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7440 is located from position 70649160 to position 70649248 relative to chromosome chr12 on the `-` strand (chr is an abbreviation for chromosome).

GR7440 precursor RNA folds spatially, forming GR7440 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7440 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7440 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7440 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337088 precursor RNA and GAM337089 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337088 RNA and GAM337089 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337088 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337088 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337088 target RNA into GAM337088 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337089 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337089 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337089 target RNA into GAM337089 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7440 polynucleotide correlate with, and may be deduced from, the identity of

the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7440 polynucleotide: GAM337088 target protein and GAM337089 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337088 and GAM337089

GR7441 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7441(GR7441) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7441 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7441 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7441 precursor DNA encodes GR7441 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7441 is located from position 96681277 to position 96681380 relative to chromosome chr12 on the `-` strand (chr is an abbreviation for chromosome).

GR7441 precursor RNA folds spatially, forming GR7441 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7441 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7441 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7441 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337288 precursor RNA and GAM337289 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337288 RNA and GAM337289 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337288 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337288 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to

a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337288 target RNA into GAM337288 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337289 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337289 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337289 target RNA into GAM337289 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7441 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7441 polynucleotide: GAM337288 target protein and GAM337289 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337288 and GAM337289

GR7442 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7442(GR7442) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7442 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7442 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7442 precursor DNA encodes GR7442 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7442 is located from position 24214818 to position 24214925 relative to chromosome chr13 on the `+` strand (chr is an abbreviation for chromosome).

GR7442 precursor RNA folds spatially, forming GR7442 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7442 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7442 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7442 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate

GAM precursor RNAs, GAM336530 precursor RNA and GAM336531 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336530 RNA and GAM336531 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336530 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336530 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336530 target RNA into GAM336530 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336531 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336531 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336531 target RNA into GAM336531 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7442 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7442 polynucleotide: GAM336530 target protein and GAM336531 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336530 and GAM336531

GR7443 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7443(GR7443) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7443 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7443 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7443 precursor DNA encodes GR7443 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand

nucleotides long. Nucleotide sequence of GR7443 is located from position 26088279 to position 26088406 relative to chromosome chr13 on the `+` strand (chr is an abbreviation for chromosome).

GR7443 precursor RNA folds spatially, forming GR7443 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7443 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7443 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7443 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1144 precursor RNA and GAM7369 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1144 RNA and GAM7369 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM1144 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM1144 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1144 target RNA into GAM1144 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM7369 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM7369 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM7369 target RNA into GAM7369 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7443 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7443 polynucleotide: GAM1144 target protein and GAM7369 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM1144 and GAM7369

GR7444 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7444(GR7444) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7444 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7444 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7444 precursor DNA encodes GR7444 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7444 is located from position 97963174 to position 97963274 relative to chromosome chr13 on the `-` strand (chr is an abbreviation for chromosome).

GR7444 precursor RNA folds spatially, forming GR7444 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7444 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7444 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7444 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337296 precursor RNA and GAM337297 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337296 RNA and GAM337297 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337296 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337296 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337296 target RNA into GAM337296 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337297 RNA, herein schematically represented by GAM1 RNA through

GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337297 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337297 target RNA into GAM337297 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7444 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7444 polynucleotide: GAM337296 target protein and GAM337297 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337296 and GAM337297

GR7445 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7445(GR7445) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7445 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7445 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7445 precursor DNA encodes GR7445 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7445 is located from position 110102077 to position 110102191 relative to chromosome chr13 on the `-` strand (chr is an abbreviation for chromosome).

GR7445 precursor RNA folds spatially, forming GR7445 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7445 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7445 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7445 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM4205 precursor RNA and GAM6811 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM4205 RNA and GAM6811 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM4205 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM4205 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM4205 target RNA into GAM4205 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM6811 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM6811 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM6811 target RNA into GAM6811 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7445 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7445 polynucleotide: GAM4205 target protein and GAM6811 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM4205 and GAM6811

GR7446 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7446(GR7446) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7446 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7446 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7446 precursor DNA encodes GR7446 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7446 is located from position 62330677 to position 62330789 relative to chromosome chr14 on the `+` strand (chr is an abbreviation for chromosome).

GR7446 precursor RNA folds spatially, forming GR7446 folded precursor

RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7446 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7446 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7446 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336965 precursor RNA and GAM336966 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336965 RNA and GAM336966 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336965 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336965 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336965 target RNA into GAM336965 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336966 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336966 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336966 target RNA into GAM336966 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7446 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7446 polynucleotide: GAM336965 target protein and GAM336966 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336965 and GAM336966

GR7447 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7447(GR7447) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at

least one target gene, the function and utility of which at least one target gene is known in the art.

GR7447 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7447 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7447 precursor DNA encodes GR7447 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7447 is located from position 86637061 to position 86637148 relative to chromosome chr14 on the `+` strand (chr is an abbreviation for chromosome).

GR7447 precursor RNA folds spatially, forming GR7447 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7447 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7447 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7447 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM933 precursor RNA and GAM4008 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM933 RNA and GAM4008 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM933 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM933 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM933 target RNA into GAM933 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM4008 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM4008 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM4008 target RNA into GAM4008 target

protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7447 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7447 polynucleotide: GAM933 target protein and GAM4008 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM933 and GAM4008

GR7448 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7448(GR7448) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7448 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7448 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7448 precursor DNA encodes GR7448 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7448 is located from position 89578295 to position 89578403 relative to chromosome chr14 on the `+` strand (chr is an abbreviation for chromosome).

GR7448 precursor RNA folds spatially, forming GR7448 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7448 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7448 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7448 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337240 precursor RNA and GAM337241 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337240 RNA and GAM337241 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337240 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337240 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337240 target RNA into GAM337240 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337241 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337241 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337241 target RNA into GAM337241 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7448 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7448 polynucleotide: GAM337240 target protein and GAM337241 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337240 and GAM337241

GR7449 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7449(GR7449) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7449 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7449 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7449 precursor DNA encodes GR7449 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7449 is located from position 92455725 to position 92455812 relative to chromosome chr14 on the `+` strand (chr is an abbreviation for chromosome).

GR7449 precursor RNA folds spatially, forming GR7449 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7449 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7449 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at

least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7449 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337255 precursor RNA and GAM337256 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337255 RNA and GAM337256 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337255 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337255 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337255 target RNA into GAM337255 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337256 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337256 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337256 target RNA into GAM337256 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7449 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7449 polynucleotide: GAM337255 target protein and GAM337256 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337255 and GAM337256

GR7450 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7450(GR7450) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7450 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The

method by which GR7450 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7450 precursor DNA encodes GR7450 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7450 is located from position 93614973 to position 93615067 relative to chromosome chr14 on the `+` strand (chr is an abbreviation for chromosome).

GR7450 precursor RNA folds spatially, forming GR7450 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7450 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7450 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7450 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1332 precursor RNA and GAM8636 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1332 RNA and GAM8636 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM1332 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM1332 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1332 target RNA into GAM1332 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM8636 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM8636 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM8636 target RNA into GAM8636 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7450 polynucleotide correlate with, and may be deduced from, the identity of

the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7450 polynucleotide: GAM1332 target protein and GAM8636 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM1332 and GAM8636

GR7451 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7451(GR7451) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7451 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7451 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7451 precursor DNA encodes GR7451 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7451 is located from position 62113790 to position 62113885 relative to chromosome chr14 on the `-` strand (chr is an abbreviation for chromosome).

GR7451 precursor RNA folds spatially, forming GR7451 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7451 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7451 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7451 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM408 precursor RNA and GAM1431 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM408 RNA and GAM1431 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM408 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM408 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM408 target RNA into GAM408 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM1431 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM1431 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1431 target RNA into GAM1431 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7451 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7451 polynucleotide: GAM408 target protein and GAM1431 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM408 and GAM1431

GR7452 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7452(GR7452) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7452 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7452 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7452 precursor DNA encodes GR7452 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7452 is located from position 89325453 to position 89325536 relative to chromosome chr14 on the `-` strand (chr is an abbreviation for chromosome).

GR7452 precursor RNA folds spatially, forming GR7452 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7452 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7452 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7452 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate

GAM precursor RNAs, GAM337233 precursor RNA, GAM337234 precursor RNA and GAM337235 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337233 RNA, GAM337234 RNA and GAM337235 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337233 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337233 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337233 target RNA into GAM337233 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337234 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337234 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337234 target RNA into GAM337234 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337235 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337235 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337235 target RNA into GAM337235 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7452 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7452 polynucleotide: GAM337233 target protein, GAM337234 target protein and GAM337235 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337233, GAM337234 and GAM337235

GR7453 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7453(GR7453) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at

least one target gene, the function and utility of which at least one target gene is known in the art.

GR7453 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7453 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7453 precursor DNA encodes GR7453 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7453 is located from position 94797902 to position 94798012 relative to chromosome chr14 on the `-` strand (chr is an abbreviation for chromosome).

GR7453 precursor RNA folds spatially, forming GR7453 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7453 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7453 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7453 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM3564 precursor RNA and GAM7664 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM3564 RNA and GAM7664 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM3564 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM3564 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM3564 target RNA into GAM3564 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM7664 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM7664 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM7664 target RNA into GAM7664 target

protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7453 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7453 polynucleotide: GAM3564 target protein and GAM7664 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM3564 and GAM7664

GR7454 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7454(GR7454) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7454 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7454 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7454 precursor DNA encodes GR7454 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7454 is located from position 40608762 to position 40608869 relative to chromosome chr15 on the `+` strand (chr is an abbreviation for chromosome).

GR7454 precursor RNA folds spatially, forming GR7454 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7454 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7454 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7454 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM507 precursor RNA and GAM1295 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM507 RNA and GAM1295 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM507 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM507 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM507 target RNA into GAM507 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM1295 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM1295 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1295 target RNA into GAM1295 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7454 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7454 polynucleotide: GAM507 target protein and GAM1295 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM507 and GAM1295

GR7455 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7455(GR7455) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7455 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7455 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7455 precursor DNA encodes GR7455 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7455 is located from position 24278760 to position 24278861 relative to chromosome chr15 on the `-` strand (chr is an abbreviation for chromosome).

GR7455 precursor RNA folds spatially, forming GR7455 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7455 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7455 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at

least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7455 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336532 precursor RNA and GAM336533 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336532 RNA and GAM336533 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336532 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336532 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336532 target RNA into GAM336532 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336533 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336533 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336533 target RNA into GAM336533 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7455 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7455 polynucleotide: GAM336532 target protein and GAM336533 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336532 and GAM336533

GR7456 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7456(GR7456) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7456 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The

method by which GR7456 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7456 precursor DNA encodes GR7456 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7456 is located from position 32850069 to position 32850178 relative to chromosome chr15 on the `-` strand (chr is an abbreviation for chromosome).

GR7456 precursor RNA folds spatially, forming GR7456 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7456 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7456 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7456 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM4996 precursor RNA and GAM5913 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM4996 RNA and GAM5913 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM4996 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM4996 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM4996 target RNA into GAM4996 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM5913 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM5913 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM5913 target RNA into GAM5913 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7456 polynucleotide correlate with, and may be deduced from, the identity of

the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7456 polynucleotide: GAM4996 target protein and GAM5913 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM4996 and GAM5913

GR7457 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7457(GR7457) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7457 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7457 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7457 precursor DNA encodes GR7457 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7457 is located from position 53161338 to position 53161431 relative to chromosome chr15 on the `-` strand (chr is an abbreviation for chromosome).

GR7457 precursor RNA folds spatially, forming GR7457 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7457 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7457 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7457 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM4538 precursor RNA and GAM7302 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM4538 RNA and GAM7302 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM4538 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM4538 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM4538 target RNA into GAM4538 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM7302 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM7302 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM7302 target RNA into GAM7302 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7457 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7457 polynucleotide: GAM4538 target protein and GAM7302 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM4538 and GAM7302

GR7458 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7458(GR7458) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7458 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7458 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7458 precursor DNA encodes GR7458 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7458 is located from position 53974892 to position 53975006 relative to chromosome chr15 on the `-` strand (chr is an abbreviation for chromosome).

GR7458 precursor RNA folds spatially, forming GR7458 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7458 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7458 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7458 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate

GAM precursor RNAs, GAM807 precursor RNA, GAM2808 precursor RNA and GAM3132 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM807 RNA, GAM2808 RNA and GAM3132 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM807 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM807 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM807 target RNA into GAM807 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM2808 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM2808 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2808 target RNA into GAM2808 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM3132 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM3132 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM3132 target RNA into GAM3132 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7458 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7458 polynucleotide: GAM807 target protein, GAM2808 target protein and GAM3132 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM807, GAM2808 and GAM3132

GR7459 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7459(GR7459) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene

is known in the art.

GR7459 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7459 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7459 precursor DNA encodes GR7459 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7459 is located from position 90601712 to position 90601949 relative to chromosome chr15 on the `-` strand (chr is an abbreviation for chromosome).

GR7459 precursor RNA folds spatially, forming GR7459 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7459 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7459 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7459 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM4800 precursor RNA and GAM5958 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM4800 RNA and GAM5958 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM4800 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM4800 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM4800 target RNA into GAM4800 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM5958 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM5958 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM5958 target RNA into GAM5958 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3

TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7459 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7459 polynucleotide: GAM4800 target protein and GAM5958 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM4800 and GAM5958

GR7460 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7460(GR7460) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7460 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7460 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7460 precursor DNA encodes GR7460 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7460 is located from position 94819576 to position 94819679 relative to chromosome chr15 on the `-` strand (chr is an abbreviation for chromosome).

GR7460 precursor RNA folds spatially, forming GR7460 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7460 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7460 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7460 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337274 precursor RNA and GAM337275 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337274 RNA and GAM337275 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337274 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337274 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337274 target RNA into GAM337274 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337275 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337275 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337275 target RNA into GAM337275 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7460 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7460 polynucleotide: GAM337274 target protein and GAM337275 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337274 and GAM337275

GR7461 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7461(GR7461) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7461 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7461 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7461 precursor DNA encodes GR7461 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7461 is located from position 20421189 to position 20421286 relative to chromosome chr16 on the `+` strand (chr is an abbreviation for chromosome).

GR7461 precursor RNA folds spatially, forming GR7461 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7461 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7461 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half

thereof, as is well known in the art.

GR7461 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336477 precursor RNA and GAM336478 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336477 RNA and GAM336478 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336477 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336477 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336477 target RNA into GAM336477 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336478 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336478 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336478 target RNA into GAM336478 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7461 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7461 polynucleotide: GAM336477 target protein and GAM336478 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336477 and GAM336478

GR7462 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7462(GR7462) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7462 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7462 precursor DNA was detected is described hereinabove with

additional reference to Figs. 8-18.

GR7462 precursor DNA encodes GR7462 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7462 is located from position 24755757 to position 24755840 relative to chromosome chr16 on the `+` strand (chr is an abbreviation for chromosome).

GR7462 precursor RNA folds spatially, forming GR7462 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7462 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7462 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7462 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336537 precursor RNA and GAM336538 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336537 RNA and GAM336538 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336537 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336537 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336537 target RNA into GAM336537 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336538 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336538 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336538 target RNA into GAM336538 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7462 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like`

cluster of GR7462 polynucleotide: GAM336537 target protein and GAM336538 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336537 and GAM336538

GR7463 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7463(GR7463) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7463 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7463 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7463 precursor DNA encodes GR7463 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7463 is located from position 69459978 to position 69460084 relative to chromosome chr16 on the `+` strand (chr is an abbreviation for chromosome).

GR7463 precursor RNA folds spatially, forming GR7463 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7463 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7463 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7463 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM3064 precursor RNA and GAM337065 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM3064 RNA and GAM337065 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM3064 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM3064 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.

8, thereby inhibiting translation of GAM3064 target RNA into GAM3064 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337065 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337065 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337065 target RNA into GAM337065 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7463 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7463 polynucleotide: GAM3064 target protein and GAM337065 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM3064 and GAM337065

GR7464 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7464(GR7464) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7464 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7464 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7464 precursor DNA encodes GR7464 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7464 is located from position 78245362 to position 78245462 relative to chromosome chr16 on the `+` strand (chr is an abbreviation for chromosome).

GR7464 precursor RNA folds spatially, forming GR7464 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7464 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7464 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7464 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337185 precursor RNA and GAM337186 precursor RNA,herein

schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337185 RNA and GAM337186 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337185 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337185 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337185 target RNA into GAM337185 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337186 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337186 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337186 target RNA into GAM337186 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7464 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7464 polynucleotide: GAM337185 target protein and GAM337186 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337185 and GAM337186

GR7465 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7465(GR7465) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7465 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7465 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7465 precursor DNA encodes GR7465 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7465 is located from position 15101510

to position 15101597 relative to chromosome chr16 on the `-` strand (chr is an abbreviation for chromosome).

GR7465 precursor RNA folds spatially, forming GR7465 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7465 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7465 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7465 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2817 precursor RNA and GAM4844 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2817 RNA and GAM4844 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM2817 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM2817 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2817 target RNA into GAM2817 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM4844 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM4844 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM4844 target RNA into GAM4844 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7465 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7465 polynucleotide: GAM2817 target protein and GAM4844 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM2817 and GAM4844

GR7466 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7466(GR7466) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7466 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7466 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7466 precursor DNA encodes GR7466 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7466 is located from position 20480066 to position 20480163 relative to chromosome chr16 on the `-` strand (chr is an abbreviation for chromosome).

GR7466 precursor RNA folds spatially, forming GR7466 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7466 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7466 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7466 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336479 precursor RNA and GAM336480 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336479 RNA and GAM336480 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336479 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336479 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336479 target RNA into GAM336479 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336480 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an

untranslated region of GAM336480 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336480 target RNA into GAM336480 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7466 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7466 polynucleotide: GAM336479 target protein and GAM336480 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336479 and GAM336480

GR7467 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7467(GR7467) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7467 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7467 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7467 precursor DNA encodes GR7467 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7467 is located from position 34577774 to position 34577883 relative to chromosome chr16 on the `-` strand (chr is an abbreviation for chromosome).

GR7467 precursor RNA folds spatially, forming GR7467 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7467 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7467 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7467 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM5086 precursor RNA and GAM7416 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER

COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM5086 RNA and GAM7416 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM5086 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM5086 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM5086 target RNA into GAM5086 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM7416 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM7416 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM7416 target RNA into GAM7416 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7467 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7467 polynucleotide: GAM5086 target protein and GAM7416 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM5086 and GAM7416

GR7468 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7468(GR7468) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7468 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7468 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7468 precursor DNA encodes GR7468 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7468 is located from position 30319063 to position 30319173 relative to chromosome chr17 on the `+` strand (chr is an abbreviation for chromosome).

GR7468 precursor RNA folds spatially, forming GR7468 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7468

folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7468 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7468 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM785 precursor RNA and GAM8631 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM785 RNA and GAM8631 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM785 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM785 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM785 target RNA into GAM785 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM8631 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM8631 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM8631 target RNA into GAM8631 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7468 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7468 polynucleotide: GAM785 target protein and GAM8631 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM785 and GAM8631

GR7469 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7469(GR7469) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene

is known in the art.

GR7469 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7469 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7469 precursor DNA encodes GR7469 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7469 is located from position 40086542 to position 40086976 relative to chromosome chr17 on the `+` strand (chr is an abbreviation for chromosome).

GR7469 precursor RNA folds spatially, forming GR7469 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7469 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7469 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7469 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM4423 precursor RNA and GAM336720 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM4423 RNA and GAM336720 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM4423 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM4423 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM4423 target RNA into GAM4423 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336720 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336720 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336720 target RNA into GAM336720 target protein, herein schematically represented by GAM1 TARGET PROTEIN through

GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7469 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7469 polynucleotide: GAM4423 target protein and GAM336720 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM4423 and GAM336720

GR7470 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7470(GR7470) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7470 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7470 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7470 precursor DNA encodes GR7470 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7470 is located from position 43395837 to position 43395938 relative to chromosome chr17 on the `+` strand (chr is an abbreviation for chromosome).

GR7470 precursor RNA folds spatially, forming GR7470 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7470 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7470 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7470 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM674 precursor RNA and GAM3126 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM674 RNA and GAM3126 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM674 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM674 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM674 target RNA into GAM674 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM3126 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM3126 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM3126 target RNA into GAM3126 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7470 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7470 polynucleotide: GAM674 target protein and GAM3126 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM674 and GAM3126

GR7471 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7471(GR7471) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7471 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7471 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7471 precursor DNA encodes GR7471 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7471 is located from position 78873540 to position 78873673 relative to chromosome chr17 on the `+` strand (chr is an abbreviation for chromosome).

GR7471 precursor RNA folds spatially, forming GR7471 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7471 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7471 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half

thereof, as is well known in the art.

GR7471 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM2868 precursor RNA, GAM6466 precursor RNA and GAM6564 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2868 RNA, GAM6466 RNA and GAM6564 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM2868 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM2868 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2868 target RNA into GAM2868 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM6466 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM6466 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM6466 target RNA into GAM6466 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM6564 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM6564 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM6564 target RNA into GAM6564 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7471 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7471 polynucleotide: GAM2868 target protein, GAM6466 target protein and GAM6564 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM2868, GAM6466 and GAM6564

 Fig. 16 further provides a conceptual description of novel bioinformatically

detected regulatory polynucleotide, referred to here as Genomic Record 7472(GR7472) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7472 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7472 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7472 precursor DNA encodes GR7472 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7472 is located from position 1319182 to position 1319275 relative to chromosome chr17 on the `-` strand (chr is an abbreviation for chromosome).

GR7472 precursor RNA folds spatially, forming GR7472 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7472 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7472 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7472 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM842 precursor RNA and GAM2920 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM842 RNA and GAM2920 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM842 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM842 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM842 target RNA into GAM842 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM2920 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM2920 target RNA, herein schematically represented by GAM1 TARGET RNA

through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2920 target RNA into GAM2920 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7472 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7472 polynucleotide: GAM842 target protein and GAM2920 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM842 and GAM2920

GR7473 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7473(GR7473) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7473 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7473 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7473 precursor DNA encodes GR7473 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7473 is located from position 2260318 to position 2260393 relative to chromosome chr17 on the `-` strand (chr is an abbreviation for chromosome).

GR7473 precursor RNA folds spatially, forming GR7473 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7473 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7473 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7473 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1313 precursor RNA and GAM3487 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides

in length, GAM1313 RNA and GAM3487 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM1313 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM1313 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1313 target RNA into GAM1313 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM3487 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM3487 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM3487 target RNA into GAM3487 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7473 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7473 polynucleotide: GAM1313 target protein and GAM3487 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM1313 and GAM3487

GR7474 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7474(GR7474) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7474 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7474 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7474 precursor DNA encodes GR7474 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7474 is located from position 6197075 to position 6197181 relative to chromosome chr17 on the `-` strand (chr is an abbreviation for chromosome).

GR7474 precursor RNA folds spatially, forming GR7474 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7474 folded precursor RNA comprises a plurality of what is known in the art as

`hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7474 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7474 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM4027 precursor RNA and GAM6996 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM4027 RNA and GAM6996 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM4027 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM4027 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM4027 target RNA into GAM4027 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM6996 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM6996 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM6996 target RNA into GAM6996 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7474 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7474 polynucleotide: GAM4027 target protein and GAM6996 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM4027 and GAM6996

GR7475 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7475(GR7475) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7475 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7475 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7475 precursor DNA encodes GR7475 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7475 is located from position 15083193 to position 15083304 relative to chromosome chr17 on the `-` strand (chr is an abbreviation for chromosome).

GR7475 precursor RNA folds spatially, forming GR7475 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7475 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7475 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7475 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336410 precursor RNA and GAM336411 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336410 RNA and GAM336411 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336410 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336410 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336410 target RNA into GAM336410 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336411 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336411 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336411 target RNA into GAM336411 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7475 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7475 polynucleotide: GAM336410 target protein and GAM336411 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336410 and GAM336411

GR7476 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7476(GR7476) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7476 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7476 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7476 precursor DNA encodes GR7476 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7476 is located from position 40762540 to position 40762622 relative to chromosome chr17 on the `-` strand (chr is an abbreviation for chromosome).

GR7476 precursor RNA folds spatially, forming GR7476 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7476 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7476 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7476 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336731 precursor RNA and GAM336732 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336731 RNA and GAM336732 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336731 RNA, herein schematically represented by GAM1 RNA through

GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336731 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336731 target RNA into GAM336731 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336732 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336732 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336732 target RNA into GAM336732 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7476 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7476 polynucleotide: GAM336731 target protein and GAM336732 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336731 and GAM336732

GR7477 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7477(GR7477) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7477 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7477 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7477 precursor DNA encodes GR7477 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7477 is located from position 42527933 to position 42528035 relative to chromosome chr17 on the `-` strand (chr is an abbreviation for chromosome).

GR7477 precursor RNA folds spatially, forming GR7477 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7477 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7477 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7477 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336755 precursor RNA and GAM336756 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336755 RNA and GAM336756 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336755 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336755 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336755 target RNA into GAM336755 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336756 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336756 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336756 target RNA into GAM336756 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7477 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7477 polynucleotide: GAM336755 target protein and GAM336756 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336755 and GAM336756

GR7478 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7478(GR7478) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7478 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7478 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7478 precursor DNA encodes GR7478 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7478 is located from position 76816688 to position 76816818 relative to chromosome chr17 on the `-` strand (chr is an abbreviation for chromosome).

GR7478 precursor RNA folds spatially, forming GR7478 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7478 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7478 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7478 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2014 precursor RNA and GAM8164 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2014 RNA and GAM8164 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM2014 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM2014 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2014 target RNA into GAM2014 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM8164 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM8164 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM8164 target RNA into GAM8164 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7478 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7478 polynucleotide: GAM2014 target protein and GAM8164 target

protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM2014 and GAM8164

GR7479 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7479(GR7479) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7479 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7479 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7479 precursor DNA encodes GR7479 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7479 is located from position 182463 to position 182568 relative to chromosome chr18 on the `+` strand (chr is an abbreviation for chromosome).

GR7479 precursor RNA folds spatially, forming GR7479 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7479 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7479 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7479 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM4376 precursor RNA and GAM6121 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM4376 RNA and GAM6121 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM4376 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM4376 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM4376 target RNA into GAM4376 target

protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM6121 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM6121 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM6121 target RNA into GAM6121 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7479 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7479 polynucleotide: GAM4376 target protein and GAM6121 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM4376 and GAM6121

GR7480 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7480(GR7480) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7480 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7480 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7480 precursor DNA encodes GR7480 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7480 is located from position 9906418 to position 9906526 relative to chromosome chr18 on the `+` strand (chr is an abbreviation for chromosome).

GR7480 precursor RNA folds spatially, forming GR7480 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7480 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7480 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7480 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336345 precursor RNA and GAM336346 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED

PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336345 RNA and GAM336346 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336345 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336345 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336345 target RNA into GAM336345 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336346 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336346 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336346 target RNA into GAM336346 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7480 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7480 polynucleotide: GAM336345 target protein and GAM336346 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336345 and GAM336346

GR7481 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7481(GR7481) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7481 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7481 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7481 precursor DNA encodes GR7481 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7481 is located from position 44470838 to position 44470931 relative to chromosome chr18 on the `-` strand (chr is an

abbreviation for chromosome).

GR7481 precursor RNA folds spatially, forming GR7481 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7481 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7481 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7481 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM5074 precursor RNA and GAM6105 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM5074 RNA and GAM6105 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM5074 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM5074 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM5074 target RNA into GAM5074 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM6105 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM6105 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM6105 target RNA into GAM6105 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7481 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7481 polynucleotide: GAM5074 target protein and GAM6105 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM5074 and GAM6105

GR7482 Fig. 16 further provides a conceptual description of novel bioinformatically

detected regulatory polynucleotide, referred to here as Genomic Record 7482(GR7482) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7482 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7482 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7482 precursor DNA encodes GR7482 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7482 is located from position 37551253 to position 37551384 relative to chromosome chr19 on the `+` strand (chr is an abbreviation for chromosome).

GR7482 precursor RNA folds spatially, forming GR7482 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7482 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7482 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7482 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM4796 precursor RNA and GAM5374 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM4796 RNA and GAM5374 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM4796 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM4796 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM4796 target RNA into GAM4796 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM5374 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM5374 target RNA, herein schematically represented by GAM1 TARGET RNA

through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM5374 target RNA into GAM5374 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7482 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7482 polynucleotide: GAM4796 target protein and GAM5374 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM4796 and GAM5374

GR7483 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7483(GR7483) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7483 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7483 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7483 precursor DNA encodes GR7483 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7483 is located from position 43546115 to position 43546218 relative to chromosome chr19 on the `+` strand (chr is an abbreviation for chromosome).

GR7483 precursor RNA folds spatially, forming GR7483 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7483 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7483 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7483 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM6055 precursor RNA and GAM7954 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides

in length, GAM6055 RNA and GAM7954 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM6055 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM6055 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM6055 target RNA into GAM6055 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM7954 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM7954 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM7954 target RNA into GAM7954 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7483 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7483 polynucleotide: GAM6055 target protein and GAM7954 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM6055 and GAM7954

GR7484 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7484(GR7484) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7484 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7484 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7484 precursor DNA encodes GR7484 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7484 is located from position 54394158 to position 54394244 relative to chromosome chr19 on the `+` strand (chr is an abbreviation for chromosome).

GR7484 precursor RNA folds spatially, forming GR7484 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7484 folded precursor RNA comprises a plurality of what is known in the art as

`hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7484 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7484 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM4571 precursor RNA and GAM5008 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM4571 RNA and GAM5008 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM4571 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM4571 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM4571 target RNA into GAM4571 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM5008 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM5008 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM5008 target RNA into GAM5008 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7484 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7484 polynucleotide: GAM4571 target protein and GAM5008 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM4571 and GAM5008

GR7485 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7485(GR7485) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7485 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7485 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7485 precursor DNA encodes GR7485 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7485 is located from position 16837776 to position 16838154 relative to chromosome chr19 on the `-` strand (chr is an abbreviation for chromosome).

GR7485 precursor RNA folds spatially, forming GR7485 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7485 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7485 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7485 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM556 precursor RNA and GAM5640 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM556 RNA and GAM5640 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM556 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM556 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM556 target RNA into GAM556 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM5640 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM5640 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM5640 target RNA into GAM5640 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7485 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7485 polynucleotide: GAM556 target protein and GAM5640 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM556 and GAM5640

GR7486 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7486(GR7486) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7486 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7486 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7486 precursor DNA encodes GR7486 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7486 is located from position 32944216 to position 32944302 relative to chromosome chr19 on the `-` strand (chr is an abbreviation for chromosome).

GR7486 precursor RNA folds spatially, forming GR7486 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7486 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7486 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7486 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM4189 precursor RNA and GAM5703 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM4189 RNA and GAM5703 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM4189 RNA, herein schematically represented by GAM1 RNA through GAM3

RNA, binds complementarily to a target binding site located in an untranslated region of GAM4189 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM4189 target RNA into GAM4189 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM5703 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM5703 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM5703 target RNA into GAM5703 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7486 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7486 polynucleotide: GAM4189 target protein and GAM5703 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM4189 and GAM5703

GR7487 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7487(GR7487) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7487 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7487 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7487 precursor DNA encodes GR7487 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7487 is located from position 45455573 to position 45455685 relative to chromosome chr19 on the `-` strand (chr is an abbreviation for chromosome).

GR7487 precursor RNA folds spatially, forming GR7487 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7487 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7487 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7487 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336792 precursor RNA and GAM336793 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336792 RNA and GAM336793 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336792 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336792 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336792 target RNA into GAM336792 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336793 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336793 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336793 target RNA into GAM336793 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7487 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7487 polynucleotide: GAM336792 target protein and GAM336793 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336792 and GAM336793

GR7488 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7488(GR7488) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7488 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7488 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7488 precursor DNA encodes GR7488 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7488 is located from position 74273377 to position 74273476 relative to chromosome chr2 on the `+` strand (chr is an abbreviation for chromosome).

GR7488 precursor RNA folds spatially, forming GR7488 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7488 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7488 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7488 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM337146 precursor RNA, GAM337147 precursor RNA and GAM337148 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337146 RNA, GAM337147 RNA and GAM337148 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337146 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337146 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337146 target RNA into GAM337146 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337147 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337147 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337147 target RNA into GAM337147 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337148 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337148 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to

a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337148 target RNA into GAM337148 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7488 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7488 polynucleotide: GAM337146 target protein, GAM337147 target protein and GAM337148 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337146, GAM337147 and GAM337148

GR7489 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7489(GR7489) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7489 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7489 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7489 precursor DNA encodes GR7489 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7489 is located from position 108115430 to position 108115533 relative to chromosome chr2 on the `+` strand (chr is an abbreviation for chromosome).

GR7489 precursor RNA folds spatially, forming GR7489 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7489 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7489 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7489 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM337395 precursor RNA, GAM337396 precursor RNA and GAM337397 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER

COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337395 RNA, GAM337396 RNA and GAM337397 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337395 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337395 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337395 target RNA into GAM337395 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337396 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337396 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337396 target RNA into GAM337396 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337397 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337397 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337397 target RNA into GAM337397 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7489 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7489 polynucleotide: GAM337395 target protein, GAM337396 target protein and GAM337397 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337395, GAM337396 and GAM337397

GR7490 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7490(GR7490) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7490 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7490 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7490 precursor DNA encodes GR7490 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7490 is located from position 110164979 to position 110165082 relative to chromosome chr2 on the `+` strand (chr is an abbreviation for chromosome).

GR7490 precursor RNA folds spatially, forming GR7490 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7490 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7490 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7490 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM337409 precursor RNA, GAM337410 precursor RNA and GAM337411 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337409 RNA, GAM337410 RNA and GAM337411 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337409 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337409 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337409 target RNA into GAM337409 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337410 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337410 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337410 target RNA into GAM337410 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337411 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337411 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to

a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337411 target RNA into GAM337411 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7490 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7490 polynucleotide: GAM337409 target protein, GAM337410 target protein and GAM337411 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337409, GAM337410 and GAM337411

GR7491 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7491(GR7491) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7491 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7491 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7491 precursor DNA encodes GR7491 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7491 is located from position 222613184 to position 222613280 relative to chromosome chr2 on the `+` strand (chr is an abbreviation for chromosome).

GR7491 precursor RNA folds spatially, forming GR7491 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7491 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7491 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7491 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337632 precursor RNA and GAM337633 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides

in length, GAM337632 RNA and GAM337633 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337632 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337632 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337632 target RNA into GAM337632 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337633 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337633 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337633 target RNA into GAM337633 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7491 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7491 polynucleotide: GAM337632 target protein and GAM337633 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337632 and GAM337633

GR7492 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7492(GR7492) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7492 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7492 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7492 precursor DNA encodes GR7492 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7492 is located from position 9554905 to position 9555007 relative to chromosome chr2 on the `-` strand (chr is an abbreviation for chromosome).

GR7492 precursor RNA folds spatially, forming GR7492 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7492 folded precursor RNA comprises a plurality of what is known in the art as

`hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7492 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7492 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336336 precursor RNA and GAM336337 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336336 RNA and GAM336337 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336336 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336336 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336336 target RNA into GAM336336 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336337 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336337 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336337 target RNA into GAM336337 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7492 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7492 polynucleotide: GAM336336 target protein and GAM336337 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336336 and GAM336337

GR7493 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7493(GR7493) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7493 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7493 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7493 precursor DNA encodes GR7493 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7493 is located from position 106622467 to position 106622570 relative to chromosome chr2 on the `-` strand (chr is an abbreviation for chromosome).

GR7493 precursor RNA folds spatially, forming GR7493 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7493 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7493 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7493 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM337385 precursor RNA, GAM337386 precursor RNA and GAM337387 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337385 RNA, GAM337386 RNA and GAM337387 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337385 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337385 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337385 target RNA into GAM337385 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337386 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337386 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337386 target RNA into GAM337386 target protein, herein schematically represented by GAM1 TARGET PROTEIN through

GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337387 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337387 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337387 target RNA into GAM337387 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7493 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7493 polynucleotide: GAM337385 target protein, GAM337386 target protein and GAM337387 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337385, GAM337386 and GAM337387

GR7494 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7494(GR7494) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7494 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7494 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7494 precursor DNA encodes GR7494 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7494 is located from position 110894746 to position 110894849 relative to chromosome chr2 on the `-` strand (chr is an abbreviation for chromosome).

GR7494 precursor RNA folds spatially, forming GR7494 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7494 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7494 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7494 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM337415 precursor RNA, GAM337416 precursor RNA and GAM337417 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR

RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337415 RNA, GAM337416 RNA and GAM337417 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337415 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337415 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337415 target RNA into GAM337415 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337416 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337416 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337416 target RNA into GAM337416 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337417 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337417 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337417 target RNA into GAM337417 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7494 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7494 polynucleotide: GAM337415 target protein, GAM337416 target protein and GAM337417 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337415, GAM337416 and GAM337417

GR7495 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7495(GR7495) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7495 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7495 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7495 precursor DNA encodes GR7495 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7495 is located from position 113030916 to position 113031019 relative to chromosome chr2 on the `-` strand (chr is an abbreviation for chromosome).

GR7495 precursor RNA folds spatially, forming GR7495 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7495 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7495 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7495 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM337438 precursor RNA, GAM337439 precursor RNA and GAM337440 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337438 RNA, GAM337439 RNA and GAM337440 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337438 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337438 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337438 target RNA into GAM337438 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337439 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337439 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337439 target RNA into GAM337439 target protein, herein schematically represented by GAM1 TARGET PROTEIN through

GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337440 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337440 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337440 target RNA into GAM337440 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7495 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7495 polynucleotide: GAM337438 target protein, GAM337439 target protein and GAM337440 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337438, GAM337439 and GAM337440

GR7496 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7496(GR7496) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7496 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7496 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7496 precursor DNA encodes GR7496 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7496 is located from position 3852982 to position 3853068 relative to chromosome chr20 on the `+` strand (chr is an abbreviation for chromosome).

GR7496 precursor RNA folds spatially, forming GR7496 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7496 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7496 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7496 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM3266 precursor RNA and GAM5916 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED

PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM3266 RNA and GAM5916 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM3266 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM3266 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM3266 target RNA into GAM3266 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM5916 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM5916 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM5916 target RNA into GAM5916 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7496 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7496 polynucleotide: GAM3266 target protein and GAM5916 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM3266 and GAM5916

GR7497 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7497(GR7497) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7497 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7497 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7497 precursor DNA encodes GR7497 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7497 is located from position 19890625 to position 19890731 relative to chromosome chr20 on the `+` strand (chr is an

abbreviation for chromosome).

GR7497 precursor RNA folds spatially, forming GR7497 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7497 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7497 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7497 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336466 precursor RNA and GAM336467 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336466 RNA and GAM336467 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336466 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336466 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336466 target RNA into GAM336466 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336467 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336467 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336467 target RNA into GAM336467 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7497 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7497 polynucleotide: GAM336466 target protein and GAM336467 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336466 and GAM336467

GR7498 Fig. 16 further provides a conceptual description of novel bioinformatically

detected regulatory polynucleotide, referred to here as Genomic Record 7498(GR7498) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7498 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7498 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7498 precursor DNA encodes GR7498 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7498 is located from position 35736486 to position 35736585 relative to chromosome chr20 on the `+` strand (chr is an abbreviation for chromosome).

GR7498 precursor RNA folds spatially, forming GR7498 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7498 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7498 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7498 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 4 separate GAM precursor RNAs, GAM336661 precursor RNA, GAM336662 precursor RNA, GAM336663 precursor RNA and GAM336664 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336661 RNA, GAM336662 RNA, GAM336663 RNA and GAM336664 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336661 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336661 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336661 target RNA into GAM336661 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336662 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an

untranslated region of GAM336662 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336662 target RNA into GAM336662 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336663 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336663 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336663 target RNA into GAM336663 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336664 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336664 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336664 target RNA into GAM336664 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7498 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7498 polynucleotide: GAM336661 target protein, GAM336662 target protein, GAM336663 target protein and GAM336664 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336661, GAM336662, GAM336663 and GAM336664

GR7499 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7499(GR7499) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7499 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7499 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7499 precursor DNA encodes GR7499 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7499 is located from position 34777096 to position 34777191 relative to chromosome chr20 on the `-` strand (chr is an abbreviation for chromosome).

GR7499 precursor RNA folds spatially, forming GR7499 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7499 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7499 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7499 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM336648 precursor RNA, GAM336649 precursor RNA and GAM336650 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336648 RNA, GAM336649 RNA and GAM336650 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336648 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336648 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336648 target RNA into GAM336648 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336649 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336649 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336649 target RNA into GAM336649 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336650 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336650 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336650 target RNA into GAM336650 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7499 polynucleotide correlate with, and may be deduced from, the identity of

the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7499 polynucleotide: GAM336648 target protein, GAM336649 target protein and GAM336650 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336648, GAM336649 and GAM336650

GR7500 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7500(GR7500) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7500 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7500 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7500 precursor DNA encodes GR7500 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7500 is located from position 46615364 to position 46615468 relative to chromosome chr20 on the `-` strand (chr is an abbreviation for chromosome).

GR7500 precursor RNA folds spatially, forming GR7500 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7500 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7500 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7500 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM750 precursor RNA and GAM1887 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM750 RNA and GAM1887 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM750 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM750 target RNA, herein schematically represented by GAM1 TARGET RNA

through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM750 target RNA into GAM750 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM1887 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM1887 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1887 target RNA into GAM1887 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7500 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7500 polynucleotide: GAM750 target protein and GAM1887 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM750 and GAM1887

GR7501 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7501(GR7501) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7501 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7501 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7501 precursor DNA encodes GR7501 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7501 is located from position 50175599 to position 50175688 relative to chromosome chr20 on the `-` strand (chr is an abbreviation for chromosome).

GR7501 precursor RNA folds spatially, forming GR7501 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7501 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7501 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7501 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA,

is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2223 precursor RNA and GAM7889 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2223 RNA and GAM7889 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM2223 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM2223 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2223 target RNA into GAM2223 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM7889 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM7889 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM7889 target RNA into GAM7889 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7501 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7501 polynucleotide: GAM2223 target protein and GAM7889 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM2223 and GAM7889

GR7502 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7502(GR7502) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7502 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7502 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7502 precursor DNA encodes GR7502 precursor RNA, herein designated GR

PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7502 is located from position 34257285 to position 34257380 relative to chromosome chr21 on the `+` strand (chr is an abbreviation for chromosome).

GR7502 precursor RNA folds spatially, forming GR7502 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7502 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7502 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7502 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336642 precursor RNA and GAM336643 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336642 RNA and GAM336643 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336642 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336642 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336642 target RNA into GAM336642 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336643 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336643 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336643 target RNA into GAM336643 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7502 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7502 polynucleotide: GAM336642 target protein and GAM336643 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with

references to GAM336642 and GAM336643

GR7503 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7503(GR7503) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7503 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7503 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7503 precursor DNA encodes GR7503 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7503 is located from position 37187787 to position 37187892 relative to chromosome chr21 on the `-` strand (chr is an abbreviation for chromosome).

GR7503 precursor RNA folds spatially, forming GR7503 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7503 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7503 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7503 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336678 precursor RNA and GAM336679 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336678 RNA and GAM336679 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336678 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336678 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336678 target RNA into GAM336678 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336679 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336679 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336679 target RNA into GAM336679 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7503 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7503 polynucleotide: GAM336678 target protein and GAM336679 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336678 and GAM336679

GR7504 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7504(GR7504) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7504 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7504 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7504 precursor DNA encodes GR7504 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7504 is located from position 48973458 to position 48973552 relative to chromosome chr22 on the `+` strand (chr is an abbreviation for chromosome).

GR7504 precursor RNA folds spatially, forming GR7504 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7504 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7504 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7504 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336844 precursor RNA and GAM336845 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336844 RNA and GAM336845 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336844 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336844 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336844 target RNA into GAM336844 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336845 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336845 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336845 target RNA into GAM336845 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7504 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7504 polynucleotide: GAM336844 target protein and GAM336845 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336844 and GAM336845

GR7505 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7505(GR7505) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7505 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7505 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7505 precursor DNA encodes GR7505 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7505 is located from position 22354493 to position 22354606 relative to chromosome chr22 on the `-` strand (chr is an abbreviation for chromosome).

GR7505 precursor RNA folds spatially, forming GR7505 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7505 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7505 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7505 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2300 precursor RNA and GAM2391 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2300 RNA and GAM2391 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM2300 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM2300 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2300 target RNA into GAM2300 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM2391 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM2391 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2391 target RNA into GAM2391 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7505 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7505 polynucleotide: GAM2300 target protein and GAM2391 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM2300 and GAM2391

GR7506 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7506(GR7506) polynucleotide, which encodes an `operon-like` cluster of novel

micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7506 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7506 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7506 precursor DNA encodes GR7506 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7506 is located from position 32141176 to position 32141267 relative to chromosome chr22 on the `-` strand (chr is an abbreviation for chromosome).

GR7506 precursor RNA folds spatially, forming GR7506 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7506 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7506 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7506 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336612 precursor RNA and GAM336613 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336612 RNA and GAM336613 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336612 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336612 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336612 target RNA into GAM336612 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336613 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336613 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III

of Fig. 8, thereby inhibiting translation of GAM336613 target RNA into GAM336613 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7506 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7506 polynucleotide: GAM336612 target protein and GAM336613 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336612 and GAM336613

GR7507 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7507(GR7507) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7507 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7507 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7507 precursor DNA encodes GR7507 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7507 is located from position 43677889 to position 43677981 relative to chromosome chr22 on the `-` strand (chr is an abbreviation for chromosome).

GR7507 precursor RNA folds spatially, forming GR7507 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7507 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7507 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7507 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1786 precursor RNA and GAM8611 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1786 RNA and GAM8611 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig.

8.

GAM1786 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM1786 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1786 target RNA into GAM1786 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM8611 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM8611 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM8611 target RNA into GAM8611 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7507 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7507 polynucleotide: GAM1786 target protein and GAM8611 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM1786 and GAM8611

GR7508 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7508(GR7508) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7508 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7508 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7508 precursor DNA encodes GR7508 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7508 is located from position 44721785 to position 44721915 relative to chromosome chr22 on the `-` strand (chr is an abbreviation for chromosome).

GR7508 precursor RNA folds spatially, forming GR7508 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7508 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7508 precursor RNA comprises a plurality of segments,

the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7508 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1479 precursor RNA and GAM6982 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1479 RNA and GAM6982 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM1479 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM1479 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1479 target RNA into GAM1479 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM6982 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM6982 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM6982 target RNA into GAM6982 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7508 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7508 polynucleotide: GAM1479 target protein and GAM6982 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM1479 and GAM6982

GR7509 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7509(GR7509) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7509 precursor DNA, herein designated GR PRECURSOR DNA, is a novel

bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7509 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7509 precursor DNA encodes GR7509 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7509 is located from position 89368234 to position 89368332 relative to chromosome chr4 on the `+` strand (chr is an abbreviation for chromosome).

GR7509 precursor RNA folds spatially, forming GR7509 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7509 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7509 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7509 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337237 precursor RNA and GAM337238 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337237 RNA and GAM337238 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337237 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337237 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337237 target RNA into GAM337237 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337238 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337238 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337238 target RNA into GAM337238 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities,

of GR7509 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7509 polynucleotide: GAM337237 target protein and GAM337238 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337237 and GAM337238

GR7510 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7510(GR7510) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7510 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7510 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7510 precursor DNA encodes GR7510 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7510 is located from position 1018984 to position 1019121 relative to chromosome chr7 on the `+` strand (chr is an abbreviation for chromosome).

GR7510 precursor RNA folds spatially, forming GR7510 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7510 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7510 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7510 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM100 precursor RNA, GAM6307 precursor RNA and GAM7179 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM100 RNA, GAM6307 RNA and GAM7179 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM100 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated

region of GAM100 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM100 target RNA into GAM100 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM6307 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM6307 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM6307 target RNA into GAM6307 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM7179 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM7179 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM7179 target RNA into GAM7179 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7510 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7510 polynucleotide: GAM100 target protein, GAM6307 target protein and GAM7179 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM100, GAM6307 and GAM7179

GR7511 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7511(GR7511) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7511 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7511 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7511 precursor DNA encodes GR7511 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7511 is located from position 17062066 to position 17062152 relative to chromosome chr7 on the `+` strand (chr is an abbreviation for chromosome).

GR7511 precursor RNA folds spatially, forming GR7511 folded precursor

RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7511 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7511 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7511 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336432 precursor RNA and GAM336433 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336432 RNA and GAM336433 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336432 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336432 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336432 target RNA into GAM336432 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336433 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336433 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336433 target RNA into GAM336433 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7511 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7511 polynucleotide: GAM336432 target protein and GAM336433 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336432 and GAM336433

GR7512 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7512(GR7512) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at

least one target gene, the function and utility of which at least one target gene is known in the art.

GR7512 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7512 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7512 precursor DNA encodes GR7512 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7512 is located from position 82178126 to position 82179721 relative to chromosome chr7 on the `-` strand (chr is an abbreviation for chromosome).

GR7512 precursor RNA folds spatially, forming GR7512 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7512 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7512 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7512 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM1088 precursor RNA, GAM2578 precursor RNA and GAM7250 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1088 RNA, GAM2578 RNA and GAM7250 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM1088 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM1088 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1088 target RNA into GAM1088 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM2578 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM2578 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.

8, thereby inhibiting translation of GAM2578 target RNA into GAM2578 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM7250 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM7250 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM7250 target RNA into GAM7250 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7512 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7512 polynucleotide: GAM1088 target protein, GAM2578 target protein and GAM7250 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM1088, GAM2578 and GAM7250

GR7513 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7513(GR7513) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7513 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7513 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7513 precursor DNA encodes GR7513 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7513 is located from position 137087025 to position 137087139 relative to chromosome chr7 on the `-` strand (chr is an abbreviation for chromosome).

GR7513 precursor RNA folds spatially, forming GR7513 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7513 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7513 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7513 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM337570 precursor RNA, GAM337571 precursor RNA and

GAM337572 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337570 RNA, GAM337571 RNA and GAM337572 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337570 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337570 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337570 target RNA into GAM337570 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337571 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337571 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337571 target RNA into GAM337571 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337572 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337572 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337572 target RNA into GAM337572 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7513 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7513 polynucleotide: GAM337570 target protein, GAM337571 target protein and GAM337572 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337570, GAM337571 and GAM337572

GR7514 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7514(GR7514) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene

is known in the art.

GR7514 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7514 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7514 precursor DNA encodes GR7514 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7514 is located from position 140693627 to position 140693723 relative to chromosome chr7 on the `-` strand (chr is an abbreviation for chromosome).

GR7514 precursor RNA folds spatially, forming GR7514 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7514 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7514 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7514 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM6618 precursor RNA and GAM6978 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM6618 RNA and GAM6978 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM6618 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM6618 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM6618 target RNA into GAM6618 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM6978 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM6978 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM6978 target RNA into GAM6978 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3

TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7514 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7514 polynucleotide: GAM6618 target protein and GAM6978 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM6618 and GAM6978

GR7515 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7515(GR7515) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7515 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7515 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7515 precursor DNA encodes GR7515 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7515 is located from position 148136535 to position 148136637 relative to chromosome chr7 on the `-` strand (chr is an abbreviation for chromosome).

GR7515 precursor RNA folds spatially, forming GR7515 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7515 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7515 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7515 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337597 precursor RNA and GAM337598 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337597 RNA and GAM337598 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337597 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337597 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337597 target RNA into GAM337597 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337598 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337598 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337598 target RNA into GAM337598 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7515 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7515 polynucleotide: GAM337597 target protein and GAM337598 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337597 and GAM337598

GR7516 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7516(GR7516) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7516 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7516 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7516 precursor DNA encodes GR7516 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7516 is located from position 150223532 to position 150223641 relative to chromosome chr7 on the `-` strand (chr is an abbreviation for chromosome).

GR7516 precursor RNA folds spatially, forming GR7516 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7516 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7516 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half

thereof, as is well known in the art.

GR7516 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM193 precursor RNA and GAM973 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM193 RNA and GAM973 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM193 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM193 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM193 target RNA into GAM193 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM973 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM973 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM973 target RNA into GAM973 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7516 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7516 polynucleotide: GAM193 target protein and GAM973 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM193 and GAM973

GR7517 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7517(GR7517) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7517 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7517 precursor DNA was detected is described hereinabove with

additional reference to Figs. 8-18.

GR7517 precursor DNA encodes GR7517 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7517 is located from position 30119301 to position 30119415 relative to chromosome chr8 on the `+` strand (chr is an abbreviation for chromosome).

GR7517 precursor RNA folds spatially, forming GR7517 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7517 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7517 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7517 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336595 precursor RNA and GAM336596 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336595 RNA and GAM336596 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336595 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336595 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336595 target RNA into GAM336595 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336596 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336596 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336596 target RNA into GAM336596 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7517 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like`

cluster of GR7517 polynucleotide: GAM336595 target protein and GAM336596 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336595 and GAM336596

GR7518 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7518(GR7518) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7518 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7518 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7518 precursor DNA encodes GR7518 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7518 is located from position 33338251 to position 33338352 relative to chromosome chr9 on the `+` strand (chr is an abbreviation for chromosome).

GR7518 precursor RNA folds spatially, forming GR7518 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7518 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7518 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7518 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336630 precursor RNA and GAM336631 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336630 RNA and GAM336631 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336630 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336630 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III

of Fig. 8, thereby inhibiting translation of GAM336630 target RNA into GAM336630 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336631 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336631 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336631 target RNA into GAM336631 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7518 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7518 polynucleotide: GAM336630 target protein and GAM336631 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336630 and GAM336631

GR7519 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7519(GR7519) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7519 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7519 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7519 precursor DNA encodes GR7519 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7519 is located from position 35798279 to position 35798393 relative to chromosome chr9 on the `+` strand (chr is an abbreviation for chromosome).

GR7519 precursor RNA folds spatially, forming GR7519 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7519 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7519 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7519 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1550 precursor RNA and GAM1937 precursor RNA,herein

schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1550 RNA and GAM1937 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM1550 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM1550 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1550 target RNA into GAM1550 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM1937 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM1937 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1937 target RNA into GAM1937 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7519 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7519 polynucleotide: GAM1550 target protein and GAM1937 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM1550 and GAM1937

GR7520 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7520(GR7520) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7520 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7520 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7520 precursor DNA encodes GR7520 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7520 is located from position 61973580

to position 61973685 relative to chromosome chr9 on the `+` strand (chr is an abbreviation for chromosome).

GR7520 precursor RNA folds spatially, forming GR7520 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7520 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7520 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7520 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM353 precursor RNA and GAM1445 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM353 RNA and GAM1445 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM353 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM353 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM353 target RNA into GAM353 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM1445 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM1445 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1445 target RNA into GAM1445 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7520 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7520 polynucleotide: GAM353 target protein and GAM1445 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM353 and GAM1445

GR7521 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7521(GR7521) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7521 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7521 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7521 precursor DNA encodes GR7521 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7521 is located from position 68096932 to position 68097040 relative to chromosome chr9 on the `+` strand (chr is an abbreviation for chromosome).

GR7521 precursor RNA folds spatially, forming GR7521 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7521 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7521 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7521 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337051 precursor RNA and GAM337052 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337051 RNA and GAM337052 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337051 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337051 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337051 target RNA into GAM337051 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337052 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an

untranslated region of GAM337052 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337052 target RNA into GAM337052 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7521 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7521 polynucleotide: GAM337051 target protein and GAM337052 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337051 and GAM337052

GR7522 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7522(GR7522) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7522 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7522 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7522 precursor DNA encodes GR7522 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7522 is located from position 96671073 to position 96675767 relative to chromosome chr9 on the `+` strand (chr is an abbreviation for chromosome).

GR7522 precursor RNA folds spatially, forming GR7522 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7522 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7522 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7522 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM3091 precursor RNA and GAM337287 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER

COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM3091 RNA and GAM337287 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM3091 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM3091 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM3091 target RNA into GAM3091 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337287 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337287 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337287 target RNA into GAM337287 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7522 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7522 polynucleotide: GAM3091 target protein and GAM337287 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM3091 and GAM337287

GR7523 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7523(GR7523) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7523 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7523 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7523 precursor DNA encodes GR7523 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7523 is located from position 97689214 to position 97691182 relative to chromosome chr9 on the `+` strand (chr is an abbreviation for chromosome).

GR7523 precursor RNA folds spatially, forming GR7523 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7523

folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7523 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7523 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 4 separate GAM precursor RNAs, GAM259 precursor RNA, GAM1423 precursor RNA, GAM4709 precursor RNA and GAM7363 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM259 RNA, GAM1423 RNA, GAM4709 RNA and GAM7363 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM259 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM259 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM259 target RNA into GAM259 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM1423 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM1423 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1423 target RNA into GAM1423 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM4709 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM4709 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM4709 target RNA into GAM4709 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM7363 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM7363 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.

8, thereby inhibiting translation of GAM7363 target RNA into GAM7363 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7523 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7523 polynucleotide: GAM259 target protein, GAM1423 target protein, GAM4709 target protein and GAM7363 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM259, GAM1423, GAM4709 and GAM7363

GR7524 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7524(GR7524) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7524 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7524 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7524 precursor DNA encodes GR7524 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7524 is located from position 128399235 to position 128399347 relative to chromosome chr9 on the `+` strand (chr is an abbreviation for chromosome).

GR7524 precursor RNA folds spatially, forming GR7524 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7524 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7524 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7524 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM337521 precursor RNA, GAM337522 precursor RNA and GAM337523 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides

in length, GAM337521 RNA, GAM337522 RNA and GAM337523 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337521 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337521 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337521 target RNA into GAM337521 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337522 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337522 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337522 target RNA into GAM337522 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337523 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337523 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337523 target RNA into GAM337523 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7524 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7524 polynucleotide: GAM337521 target protein, GAM337522 target protein and GAM337523 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337521, GAM337522 and GAM337523

GR7525 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7525(GR7525) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7525 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7525 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7525 precursor DNA encodes GR7525 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7525 is located from position 43025631 to position 43025765 relative to chromosome chr9 on the `-` strand (chr is an abbreviation for chromosome).

GR7525 precursor RNA folds spatially, forming GR7525 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7525 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7525 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7525 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM4986 precursor RNA, GAM5085 precursor RNA and GAM7017 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM4986 RNA, GAM5085 RNA and GAM7017 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM4986 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM4986 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM4986 target RNA into GAM4986 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM5085 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM5085 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM5085 target RNA into GAM5085 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM7017 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM7017 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.

8, thereby inhibiting translation of GAM7017 target RNA into GAM7017 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7525 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7525 polynucleotide: GAM4986 target protein, GAM5085 target protein and GAM7017 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM4986, GAM5085 and GAM7017

GR7526 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7526(GR7526) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7526 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7526 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7526 precursor DNA encodes GR7526 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7526 is located from position 62131098 to position 62131226 relative to chromosome chr9 on the `-` strand (chr is an abbreviation for chromosome).

GR7526 precursor RNA folds spatially, forming GR7526 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7526 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7526 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7526 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM2272 precursor RNA, GAM5764 precursor RNA and GAM7345 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2272 RNA, GAM5764 RNA and GAM7345 RNA, herein schematically

represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM2272 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM2272 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2272 target RNA into GAM2272 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM5764 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM5764 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM5764 target RNA into GAM5764 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM7345 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM7345 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM7345 target RNA into GAM7345 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7526 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7526 polynucleotide: GAM2272 target protein, GAM5764 target protein and GAM7345 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM2272, GAM5764 and GAM7345

GR7527 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7527(GR7527) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7527 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7527 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7527 precursor DNA encodes GR7527 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand

nucleotides long. Nucleotide sequence of GR7527 is located from position 62875338 to position 62875466 relative to chromosome chr9 on the `-` strand (chr is an abbreviation for chromosome).

GR7527 precursor RNA folds spatially, forming GR7527 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7527 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7527 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7527 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM336978 precursor RNA, GAM336980 precursor RNA and GAM336981 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336978 RNA, GAM336980 RNA and GAM336981 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336978 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336978 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336978 target RNA into GAM336978 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336980 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336980 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336980 target RNA into GAM336980 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336981 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336981 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336981 target RNA into GAM336981 target protein, herein schematically represented by GAM1 TARGET PROTEIN through

GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7527 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7527 polynucleotide: GAM336978 target protein, GAM336980 target protein and GAM336981 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336978, GAM336980 and GAM336981

GR7528 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7528(GR7528) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7528 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7528 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7528 precursor DNA encodes GR7528 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7528 is located from position 63063288 to position 63063393 relative to chromosome chr9 on the `-` strand (chr is an abbreviation for chromosome).

GR7528 precursor RNA folds spatially, forming GR7528 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7528 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7528 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7528 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336986 precursor RNA and GAM336987 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336986 RNA and GAM336987 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336986 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336986 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336986 target RNA into GAM336986 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336987 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336987 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336987 target RNA into GAM336987 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7528 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7528 polynucleotide: GAM336986 target protein and GAM336987 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336986 and GAM336987

GR7529 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7529(GR7529) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7529 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7529 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7529 precursor DNA encodes GR7529 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7529 is located from position 116757828 to position 116757946 relative to chromosome chr9 on the `-` strand (chr is an abbreviation for chromosome).

GR7529 precursor RNA folds spatially, forming GR7529 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7529 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7529 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at

least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7529 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM4932 precursor RNA, GAM6024 precursor RNA and GAM6417 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM4932 RNA, GAM6024 RNA and GAM6417 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM4932 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM4932 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM4932 target RNA into GAM4932 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM6024 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM6024 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM6024 target RNA into GAM6024 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM6417 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM6417 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM6417 target RNA into GAM6417 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7529 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7529 polynucleotide: GAM4932 target protein, GAM6024 target protein and GAM6417 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM4932, GAM6024 and GAM6417

GR7530 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7530(GR7530) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7530 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7530 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7530 precursor DNA encodes GR7530 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7530 is located from position 124608557 to position 124608671 relative to chromosome chr9 on the `-` strand (chr is an abbreviation for chromosome).

GR7530 precursor RNA folds spatially, forming GR7530 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7530 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7530 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7530 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 4 separate GAM precursor RNAs, GAM337498 precursor RNA, GAM337499 precursor RNA, GAM337500 precursor RNA and GAM337501 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337498 RNA, GAM337499 RNA, GAM337500 RNA and GAM337501 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337498 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337498 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337498 target RNA into GAM337498 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337499 RNA, herein schematically represented by GAM1 RNA through

GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337499 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337499 target RNA into GAM337499 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337500 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337500 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337500 target RNA into GAM337500 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337501 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337501 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337501 target RNA into GAM337501 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7530 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7530 polynucleotide: GAM337498 target protein, GAM337499 target protein, GAM337500 target protein and GAM337501 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337498, GAM337499, GAM337500 and GAM337501

GR7531 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7531(GR7531) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7531 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7531 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7531 precursor DNA encodes GR7531 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7531 is located from position 120997503 to position 120997605 relative to chromosome chrX on the `+` strand (chr is an abbreviation for chromosome).

GR7531 precursor RNA folds spatially, forming GR7531 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7531 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7531 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7531 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM7776 precursor RNA and GAM337476 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM7776 RNA and GAM337476 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM7776 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM7776 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM7776 target RNA into GAM7776 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337476 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337476 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337476 target RNA into GAM337476 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7531 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7531 polynucleotide: GAM7776 target protein and GAM337476 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM7776 and GAM337476

GR7532 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record

7532(GR7532) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7532 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7532 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7532 precursor DNA encodes GR7532 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7532 is located from position 136594068 to position 136594193 relative to chromosome chrX on the `+` strand (chr is an abbreviation for chromosome).

GR7532 precursor RNA folds spatially, forming GR7532 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7532 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7532 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7532 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM1782 precursor RNA, GAM8047 precursor RNA and GAM8349 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1782 RNA, GAM8047 RNA and GAM8349 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM1782 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM1782 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1782 target RNA into GAM1782 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM8047 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM8047 target RNA, herein schematically represented by GAM1 TARGET RNA

through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM8047 target RNA into GAM8047 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM8349 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM8349 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM8349 target RNA into GAM8349 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7532 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7532 polynucleotide: GAM1782 target protein, GAM8047 target protein and GAM8349 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM1782, GAM8047 and GAM8349

GR7533 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7533(GR7533) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7533 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7533 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7533 precursor DNA encodes GR7533 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7533 is located from position 7772009 to position 7772133 relative to chromosome chrX on the `-` strand (chr is an abbreviation for chromosome).

GR7533 precursor RNA folds spatially, forming GR7533 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7533 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7533 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7533 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA,

is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM5673 precursor RNA and GAM5823 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM5673 RNA and GAM5823 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM5673 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM5673 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM5673 target RNA into GAM5673 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM5823 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM5823 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM5823 target RNA into GAM5823 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7533 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7533 polynucleotide: GAM5673 target protein and GAM5823 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM5673 and GAM5823

GR7534 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7534(GR7534) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7534 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7534 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7534 precursor DNA encodes GR7534 precursor RNA, herein designated GR

PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7534 is located from position 23528432 to position 23528526 relative to chromosome chrX on the `-` strand (chr is an abbreviation for chromosome).

GR7534 precursor RNA folds spatially, forming GR7534 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7534 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7534 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7534 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336526 precursor RNA and GAM336527 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336526 RNA and GAM336527 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336526 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336526 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336526 target RNA into GAM336526 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336527 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336527 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336527 target RNA into GAM336527 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7534 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7534 polynucleotide: GAM336526 target protein and GAM336527 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with

references to GAM336526 and GAM336527

GR7535 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7535(GR7535) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7535 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7535 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7535 precursor DNA encodes GR7535 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7535 is located from position 47741101 to position 47741216 relative to chromosome chrX on the `-` strand (chr is an abbreviation for chromosome).

GR7535 precursor RNA folds spatially, forming GR7535 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7535 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7535 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7535 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM7022 precursor RNA and GAM7135 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM7022 RNA and GAM7135 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM7022 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM7022 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM7022 target RNA into GAM7022 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM7135 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM7135 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM7135 target RNA into GAM7135 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7535 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7535 polynucleotide: GAM7022 target protein and GAM7135 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM7022 and GAM7135

GR7536 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7536(GR7536) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7536 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7536 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7536 precursor DNA encodes GR7536 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7536 is located from position 47783494 to position 47783586 relative to chromosome chrX on the `-` strand (chr is an abbreviation for chromosome).

GR7536 precursor RNA folds spatially, forming GR7536 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7536 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7536 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7536 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336825 precursor RNA and GAM336826 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336825 RNA and GAM336826 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336825 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336825 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336825 target RNA into GAM336825 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336826 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336826 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336826 target RNA into GAM336826 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7536 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7536 polynucleotide: GAM336825 target protein and GAM336826 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336825 and GAM336826

GR7537 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7537(GR7537) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7537 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7537 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7537 precursor DNA encodes GR7537 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7537 is located from position 126882804 to position 126883120 relative to chromosome chrX on the `-` strand (chr is an abbreviation for chromosome).

GR7537 precursor RNA folds spatially, forming GR7537 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7537 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7537 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7537 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1033 precursor RNA and GAM5963 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1033 RNA and GAM5963 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM1033 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM1033 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1033 target RNA into GAM1033 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM5963 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM5963 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM5963 target RNA into GAM5963 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7537 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7537 polynucleotide: GAM1033 target protein and GAM5963 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM1033 and GAM5963

GR7540 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7540(GR7540) polynucleotide, which encodes an `operon-like` cluster of novel

micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7540 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7540 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7540 precursor DNA encodes GR7540 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7540 is located from position 11686899 to position 11687001 relative to chromosome chr1 on the `-` strand (chr is an abbreviation for chromosome).

GR7540 precursor RNA folds spatially, forming GR7540 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7540 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7540 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7540 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336373 precursor RNA and GAM336374 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336373 RNA and GAM336374 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336373 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336373 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336373 target RNA into GAM336373 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336374 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336374 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III

of Fig. 8, thereby inhibiting translation of GAM336374 target RNA into GAM336374 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7540 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7540 polynucleotide: GAM336373 target protein and GAM336374 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336373 and GAM336374

GR7541 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7541(GR7541) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7541 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7541 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7541 precursor DNA encodes GR7541 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7541 is located from position 116189890 to position 116189992 relative to chromosome chr1 on the `-` strand (chr is an abbreviation for chromosome).

GR7541 precursor RNA folds spatially, forming GR7541 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7541 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7541 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7541 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337453 precursor RNA and GAM337454 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337453 RNA and GAM337454 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of

Fig. 8.

GAM337453 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337453 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337453 target RNA into GAM337453 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337454 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337454 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337454 target RNA into GAM337454 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7541 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7541 polynucleotide: GAM337453 target protein and GAM337454 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337453 and GAM337454

GR7542 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7542(GR7542) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7542 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7542 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7542 precursor DNA encodes GR7542 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7542 is located from position 43586567 to position 43586676 relative to chromosome chr13 on the `+` strand (chr is an abbreviation for chromosome).

GR7542 precursor RNA folds spatially, forming GR7542 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7542 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7542 precursor RNA comprises a plurality of segments,

the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7542 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336770 precursor RNA and GAM336771 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336770 RNA and GAM336771 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336770 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336770 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336770 target RNA into GAM336770 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336771 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336771 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336771 target RNA into GAM336771 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7542 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7542 polynucleotide: GAM336770 target protein and GAM336771 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336770 and GAM336771

GR7543 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7543(GR7543) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7543 precursor DNA, herein designated GR PRECURSOR DNA, is a novel

bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7543 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7543 precursor DNA encodes GR7543 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7543 is located from position 30643328 to position 30643430 relative to chromosome chr16 on the `+` strand (chr is an abbreviation for chromosome).

GR7543 precursor RNA folds spatially, forming GR7543 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7543 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7543 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7543 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336599 precursor RNA and GAM336600 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336599 RNA and GAM336600 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336599 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336599 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336599 target RNA into GAM336599 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336600 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336600 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336600 target RNA into GAM336600 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities,

of GR7543 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7543 polynucleotide: GAM336599 target protein and GAM336600 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336599 and GAM336600

GR7544 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7544(GR7544) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7544 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7544 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7544 precursor DNA encodes GR7544 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7544 is located from position 47935242 to position 47935318 relative to chromosome chr17 on the `+` strand (chr is an abbreviation for chromosome).

GR7544 precursor RNA folds spatially, forming GR7544 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7544 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7544 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7544 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336827 precursor RNA and GAM336828 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336827 RNA and GAM336828 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336827 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336827 target RNA, herein schematically represented by

GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336827 target RNA into GAM336827 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336828 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336828 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336828 target RNA into GAM336828 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7544 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7544 polynucleotide: GAM336827 target protein and GAM336828 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336827 and GAM336828

GR7545 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7545(GR7545) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7545 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7545 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7545 precursor DNA encodes GR7545 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7545 is located from position 53596776 to position 53596878 relative to chromosome chr17 on the `+` strand (chr is an abbreviation for chromosome).

GR7545 precursor RNA folds spatially, forming GR7545 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7545 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7545 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7545 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA,

is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336890 precursor RNA and GAM336891 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336890 RNA and GAM336891 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336890 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336890 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336890 target RNA into GAM336890 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336891 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336891 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336891 target RNA into GAM336891 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7545 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7545 polynucleotide: GAM336890 target protein and GAM336891 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336890 and GAM336891

GR7546 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7546(GR7546) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7546 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7546 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7546 precursor DNA encodes GR7546 precursor RNA, herein designated GR

PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7546 is located from position 63490699 to position 63490788 relative to chromosome chr19 on the `+` strand (chr is an abbreviation for chromosome).

GR7546 precursor RNA folds spatially, forming GR7546 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7546 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7546 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7546 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336995 precursor RNA and GAM336996 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336995 RNA and GAM336996 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336995 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336995 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336995 target RNA into GAM336995 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336996 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336996 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336996 target RNA into GAM336996 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7546 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7546 polynucleotide: GAM336995 target protein and GAM336996 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with

references to GAM336995 and GAM336996

GR7547 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7547(GR7547) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7547 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7547 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7547 precursor DNA encodes GR7547 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7547 is located from position 8936622 to position 8936713 relative to chromosome chr19 on the `-` strand (chr is an abbreviation for chromosome).

GR7547 precursor RNA folds spatially, forming GR7547 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7547 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7547 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7547 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336327 precursor RNA and GAM336328 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336327 RNA and GAM336328 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336327 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336327 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336327 target RNA into GAM336327 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336328 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336328 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336328 target RNA into GAM336328 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7547 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7547 polynucleotide: GAM336327 target protein and GAM336328 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336327 and GAM336328

GR7548 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7548(GR7548) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7548 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7548 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7548 precursor DNA encodes GR7548 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7548 is located from position 12791804 to position 12791905 relative to chromosome chr19 on the `-` strand (chr is an abbreviation for chromosome).

GR7548 precursor RNA folds spatially, forming GR7548 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7548 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7548 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7548 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM336390 precursor RNA, GAM336391 precursor RNA and GAM336392 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of

Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336390 RNA, GAM336391 RNA and GAM336392 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336390 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336390 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336390 target RNA into GAM336390 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336391 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336391 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336391 target RNA into GAM336391 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336392 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336392 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336392 target RNA into GAM336392 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7548 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7548 polynucleotide: GAM336390 target protein, GAM336391 target protein and GAM336392 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336390, GAM336391 and GAM336392

GR7549 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7549(GR7549) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7549 precursor DNA, herein designated GR PRECURSOR DNA, is a novel

bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7549 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7549 precursor DNA encodes GR7549 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7549 is located from position 101642187 to position 101642300 relative to chromosome chr7 on the `+` strand (chr is an abbreviation for chromosome).

GR7549 precursor RNA folds spatially, forming GR7549 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7549 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7549 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7549 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM337350 precursor RNA, GAM337351 precursor RNA and GAM337352 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337350 RNA, GAM337351 RNA and GAM337352 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337350 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337350 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337350 target RNA into GAM337350 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337351 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337351 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337351 target RNA into GAM337351 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337352 RNA, herein schematically represented by GAM1 RNA through

GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337352 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337352 target RNA into GAM337352 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7549 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7549 polynucleotide: GAM337350 target protein, GAM337351 target protein and GAM337352 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337350, GAM337351 and GAM337352

GR7550 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7550(GR7550) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7550 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7550 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7550 precursor DNA encodes GR7550 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7550 is located from position 130018501 to position 130018614 relative to chromosome chr7 on the `-` strand (chr is an abbreviation for chromosome).

GR7550 precursor RNA folds spatially, forming GR7550 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7550 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7550 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7550 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM337535 precursor RNA, GAM337536 precursor RNA and GAM337537 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of

Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337535 RNA, GAM337536 RNA and GAM337537 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337535 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337535 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337535 target RNA into GAM337535 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337536 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337536 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337536 target RNA into GAM337536 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337537 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337537 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337537 target RNA into GAM337537 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7550 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7550 polynucleotide: GAM337535 target protein, GAM337536 target protein and GAM337537 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337535, GAM337536 and GAM337537

GR7551 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7551(GR7551) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7551 precursor DNA, herein designated GR PRECURSOR DNA, is a novel

bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7551 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7551 precursor DNA encodes GR7551 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7551 is located from position 65582433 to position 65582810 relative to chromosome chr9 on the `+` strand (chr is an abbreviation for chromosome).

GR7551 precursor RNA folds spatially, forming GR7551 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7551 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7551 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7551 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337016 precursor RNA and GAM337017 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337016 RNA and GAM337017 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337016 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337016 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337016 target RNA into GAM337016 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337017 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337017 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337017 target RNA into GAM337017 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities,

of GR7551 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7551 polynucleotide: GAM337016 target protein and GAM337017 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337016 and GAM337017

GR7552 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7552(GR7552) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7552 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7552 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7552 precursor DNA encodes GR7552 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7552 is located from position 92941110 to position 92941222 relative to chromosome chr9 on the `+` strand (chr is an abbreviation for chromosome).

GR7552 precursor RNA folds spatially, forming GR7552 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7552 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7552 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7552 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 4 separate GAM precursor RNAs, GAM337259 precursor RNA, GAM337260 precursor RNA, GAM337261 precursor RNA and GAM337262 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337259 RNA, GAM337260 RNA, GAM337261 RNA and GAM337262 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337259 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an

untranslated region of GAM337259 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337259 target RNA into GAM337259 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337260 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337260 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337260 target RNA into GAM337260 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337261 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337261 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337261 target RNA into GAM337261 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337262 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337262 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337262 target RNA into GAM337262 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7552 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7552 polynucleotide: GAM337259 target protein, GAM337260 target protein, GAM337261 target protein and GAM337262 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337259, GAM337260, GAM337261 and GAM337262

GR7556 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7556(GR7556) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7556 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7556 precursor DNA was detected is described hereinabove with

additional reference to Figs. 8-18.

GR7556 precursor DNA encodes GR7556 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7556 is located from position 151095622 to position 151095721 relative to chromosome chr1 on the `+` strand (chr is an abbreviation for chromosome).

GR7556 precursor RNA folds spatially, forming GR7556 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7556 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7556 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7556 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337607 precursor RNA and GAM337608 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337607 RNA and GAM337608 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337607 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337607 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337607 target RNA into GAM337607 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337608 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337608 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337608 target RNA into GAM337608 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7556 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like`

cluster of GR7556 polynucleotide: GAM337607 target protein and GAM337608 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337607 and GAM337608

GR7557 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7557(GR7557) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7557 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7557 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7557 precursor DNA encodes GR7557 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7557 is located from position 6079591 to position 6079695 relative to chromosome chr10 on the `+` strand (chr is an abbreviation for chromosome).

GR7557 precursor RNA folds spatially, forming GR7557 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7557 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7557 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7557 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336297 precursor RNA and GAM336298 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336297 RNA and GAM336298 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336297 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336297 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III

of Fig. 8, thereby inhibiting translation of GAM336297 target RNA into GAM336297 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336298 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336298 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336298 target RNA into GAM336298 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7557 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7557 polynucleotide: GAM336297 target protein and GAM336298 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336297 and GAM336298

GR7558 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7558(GR7558) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7558 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7558 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7558 precursor DNA encodes GR7558 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7558 is located from position 33721930 to position 33722030 relative to chromosome chr10 on the `+` strand (chr is an abbreviation for chromosome).

GR7558 precursor RNA folds spatially, forming GR7558 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7558 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7558 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7558 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336635 precursor RNA and GAM336636 precursor RNA,herein

schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336635 RNA and GAM336636 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336635 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336635 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336635 target RNA into GAM336635 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336636 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336636 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336636 target RNA into GAM336636 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7558 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7558 polynucleotide: GAM336635 target protein and GAM336636 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336635 and GAM336636

GR7559 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7559(GR7559) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7559 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7559 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7559 precursor DNA encodes GR7559 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7559 is located from position 34587696

to position 34587808 relative to chromosome chr10 on the `+` strand (chr is an abbreviation for chromosome).

GR7559 precursor RNA folds spatially, forming GR7559 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7559 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7559 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7559 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336644 precursor RNA and GAM336645 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336644 RNA and GAM336645 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336644 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336644 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336644 target RNA into GAM336644 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336645 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336645 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336645 target RNA into GAM336645 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7559 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7559 polynucleotide: GAM336644 target protein and GAM336645 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336644 and GAM336645

GR7560 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7560(GR7560) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7560 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7560 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7560 precursor DNA encodes GR7560 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7560 is located from position 69991881 to position 69992195 relative to chromosome chr10 on the `+` strand (chr is an abbreviation for chromosome).

GR7560 precursor RNA folds spatially, forming GR7560 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7560 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7560 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7560 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM337071 precursor RNA, GAM337072 precursor RNA and GAM337073 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337071 RNA, GAM337072 RNA and GAM337073 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337071 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337071 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337071 target RNA into GAM337071 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337072 RNA, herein schematically represented by GAM1 RNA through

GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337072 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337072 target RNA into GAM337072 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337073 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337073 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337073 target RNA into GAM337073 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7560 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7560 polynucleotide: GAM337071 target protein, GAM337072 target protein and GAM337073 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337071, GAM337072 and GAM337073

GR7561 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7561(GR7561) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7561 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7561 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7561 precursor DNA encodes GR7561 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7561 is located from position 74733011 to position 74733112 relative to chromosome chr10 on the `+` strand (chr is an abbreviation for chromosome).

GR7561 precursor RNA folds spatially, forming GR7561 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7561 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7561 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half

thereof, as is well known in the art.

GR7561 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM337154 precursor RNA, GAM337155 precursor RNA and GAM337156 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337154 RNA, GAM337155 RNA and GAM337156 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337154 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337154 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337154 target RNA into GAM337154 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337155 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337155 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337155 target RNA into GAM337155 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337156 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337156 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337156 target RNA into GAM337156 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7561 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7561 polynucleotide: GAM337154 target protein, GAM337155 target protein and GAM337156 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337154, GAM337155 and GAM337156

GR7562 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7562(GR7562) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7562 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7562 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7562 precursor DNA encodes GR7562 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7562 is located from position 79169031 to position 79169147 relative to chromosome chr10 on the `+` strand (chr is an abbreviation for chromosome).

GR7562 precursor RNA folds spatially, forming GR7562 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7562 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7562 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7562 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1443 precursor RNA and GAM5728 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1443 RNA and GAM5728 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM1443 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM1443 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1443 target RNA into GAM1443 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM5728 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated

region of GAM5728 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM5728 target RNA into GAM5728 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7562 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7562 polynucleotide: GAM1443 target protein and GAM5728 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM1443 and GAM5728

GR7563 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7563(GR7563) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7563 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7563 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7563 precursor DNA encodes GR7563 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7563 is located from position 92938874 to position 92938984 relative to chromosome chr10 on the `+` strand (chr is an abbreviation for chromosome).

GR7563 precursor RNA folds spatially, forming GR7563 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7563 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7563 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7563 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337257 precursor RNA and GAM337258 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER

COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337257 RNA and GAM337258 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337257 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337257 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337257 target RNA into GAM337257 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337258 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337258 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337258 target RNA into GAM337258 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7563 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7563 polynucleotide: GAM337257 target protein and GAM337258 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337257 and GAM337258

GR7564 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7564(GR7564) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7564 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7564 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7564 precursor DNA encodes GR7564 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7564 is located from position 95469300 to position 95469401 relative to chromosome chr10 on the `+` strand (chr is an abbreviation for chromosome).

GR7564 precursor RNA folds spatially, forming GR7564 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7564

folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7564 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7564 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337281 precursor RNA and GAM337282 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337281 RNA and GAM337282 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337281 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337281 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337281 target RNA into GAM337281 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337282 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337282 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337282 target RNA into GAM337282 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7564 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7564 polynucleotide: GAM337281 target protein and GAM337282 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337281 and GAM337282

GR7565 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7565(GR7565) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene

is known in the art.

GR7565 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7565 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7565 precursor DNA encodes GR7565 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7565 is located from position 98645765 to position 98645837 relative to chromosome chr10 on the `+` strand (chr is an abbreviation for chromosome).

GR7565 precursor RNA folds spatially, forming GR7565 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7565 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7565 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7565 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337305 precursor RNA and GAM337306 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337305 RNA and GAM337306 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337305 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337305 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337305 target RNA into GAM337305 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337306 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337306 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337306 target RNA into GAM337306 target protein, herein schematically represented by GAM1 TARGET PROTEIN through

GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7565 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7565 polynucleotide: GAM337305 target protein and GAM337306 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337305 and GAM337306

GR7566 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7566(GR7566) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7566 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7566 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7566 precursor DNA encodes GR7566 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7566 is located from position 130940694 to position 130940793 relative to chromosome chr10 on the `+` strand (chr is an abbreviation for chromosome).

GR7566 precursor RNA folds spatially, forming GR7566 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7566 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7566 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7566 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337541 precursor RNA and GAM337542 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337541 RNA and GAM337542 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337541 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337541 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337541 target RNA into GAM337541 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337542 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337542 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337542 target RNA into GAM337542 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7566 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7566 polynucleotide: GAM337541 target protein and GAM337542 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337541 and GAM337542

GR7567 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7567(GR7567) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7567 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7567 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7567 precursor DNA encodes GR7567 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7567 is located from position 36386596 to position 36386704 relative to chromosome chr10 on the `-` strand (chr is an abbreviation for chromosome).

GR7567 precursor RNA folds spatially, forming GR7567 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7567 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7567 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half

thereof, as is well known in the art.

GR7567 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM336670 precursor RNA, GAM336671 precursor RNA and GAM336672 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336670 RNA, GAM336671 RNA and GAM336672 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336670 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336670 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336670 target RNA into GAM336670 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336671 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336671 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336671 target RNA into GAM336671 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336672 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336672 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336672 target RNA into GAM336672 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7567 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7567 polynucleotide: GAM336670 target protein, GAM336671 target protein and GAM336672 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336670, GAM336671 and GAM336672

GR7568 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7568(GR7568) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7568 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7568 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7568 precursor DNA encodes GR7568 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7568 is located from position 75306320 to position 75306426 relative to chromosome chr10 on the `-` strand (chr is an abbreviation for chromosome).

GR7568 precursor RNA folds spatially, forming GR7568 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7568 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7568 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7568 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337163 precursor RNA and GAM337164 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337163 RNA and GAM337164 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337163 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337163 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337163 target RNA into GAM337163 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337164 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an

untranslated region of GAM337164 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337164 target RNA into GAM337164 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7568 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7568 polynucleotide: GAM337163 target protein and GAM337164 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337163 and GAM337164

GR7569 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7569(GR7569) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7569 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7569 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7569 precursor DNA encodes GR7569 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7569 is located from position 5537268 to position 5537355 relative to chromosome chr11 on the `+` strand (chr is an abbreviation for chromosome).

GR7569 precursor RNA folds spatially, forming GR7569 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7569 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7569 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7569 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336289 precursor RNA and GAM336290 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER

COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336289 RNA and GAM336290 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336289 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336289 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336289 target RNA into GAM336289 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336290 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336290 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336290 target RNA into GAM336290 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7569 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7569 polynucleotide: GAM336289 target protein and GAM336290 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336289 and GAM336290

GR7570 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7570(GR7570) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7570 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7570 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7570 precursor DNA encodes GR7570 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7570 is located from position 9504192 to position 9504294 relative to chromosome chr11 on the `+` strand (chr is an abbreviation for chromosome).

GR7570 precursor RNA folds spatially, forming GR7570 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7570

folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7570 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7570 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336334 precursor RNA and GAM336335 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336334 RNA and GAM336335 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336334 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336334 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336334 target RNA into GAM336334 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336335 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336335 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336335 target RNA into GAM336335 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7570 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7570 polynucleotide: GAM336334 target protein and GAM336335 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336334 and GAM336335

GR7571 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7571(GR7571) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene

is known in the art.

GR7571 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7571 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7571 precursor DNA encodes GR7571 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7571 is located from position 18148992 to position 18149072 relative to chromosome chr11 on the `+` strand (chr is an abbreviation for chromosome).

GR7571 precursor RNA folds spatially, forming GR7571 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7571 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7571 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7571 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336439 precursor RNA and GAM336440 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336439 RNA and GAM336440 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336439 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336439 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336439 target RNA into GAM336439 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336440 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336440 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336440 target RNA into GAM336440 target protein, herein schematically represented by GAM1 TARGET PROTEIN through

GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7571 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7571 polynucleotide: GAM336439 target protein and GAM336440 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336439 and GAM336440

GR7572 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7572(GR7572) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7572 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7572 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7572 precursor DNA encodes GR7572 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7572 is located from position 68013714 to position 68013821 relative to chromosome chr11 on the `+` strand (chr is an abbreviation for chromosome).

GR7572 precursor RNA folds spatially, forming GR7572 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7572 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7572 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7572 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM3195 precursor RNA and GAM7845 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM3195 RNA and GAM7845 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM3195 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM3195 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM3195 target RNA into GAM3195 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM7845 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM7845 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM7845 target RNA into GAM7845 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7572 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7572 polynucleotide: GAM3195 target protein and GAM7845 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM3195 and GAM7845

GR7573 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7573(GR7573) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7573 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7573 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7573 precursor DNA encodes GR7573 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7573 is located from position 88200943 to position 88201073 relative to chromosome chr11 on the `+` strand (chr is an abbreviation for chromosome).

GR7573 precursor RNA folds spatially, forming GR7573 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7573 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7573 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half

thereof, as is well known in the art.

GR7573 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM6567 precursor RNA and GAM8539 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM6567 RNA and GAM8539 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM6567 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM6567 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM6567 target RNA into GAM6567 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM8539 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM8539 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM8539 target RNA into GAM8539 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7573 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7573 polynucleotide: GAM6567 target protein and GAM8539 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM6567 and GAM8539

GR7574 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7574(GR7574) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7574 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7574 precursor DNA was detected is described hereinabove with

additional reference to Figs. 8-18.

GR7574 precursor DNA encodes GR7574 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7574 is located from position 90083877 to position 90083973 relative to chromosome chr11 on the `+` strand (chr is an abbreviation for chromosome).

GR7574 precursor RNA folds spatially, forming GR7574 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7574 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7574 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7574 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337245 precursor RNA and GAM337246 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337245 RNA and GAM337246 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337245 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337245 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337245 target RNA into GAM337245 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337246 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337246 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337246 target RNA into GAM337246 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7574 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like`

cluster of GR7574 polynucleotide: GAM337245 target protein and GAM337246 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337245 and GAM337246

GR7575 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7575(GR7575) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7575 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7575 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7575 precursor DNA encodes GR7575 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7575 is located from position 99654607 to position 99654738 relative to chromosome chr11 on the `+` strand (chr is an abbreviation for chromosome).

GR7575 precursor RNA folds spatially, forming GR7575 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7575 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7575 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7575 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM337326 precursor RNA, GAM337327 precursor RNA and GAM337328 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337326 RNA, GAM337327 RNA and GAM337328 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337326 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337326 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to

a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337326 target RNA into GAM337326 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337327 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337327 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337327 target RNA into GAM337327 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337328 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337328 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337328 target RNA into GAM337328 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7575 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7575 polynucleotide: GAM337326 target protein, GAM337327 target protein and GAM337328 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337326, GAM337327 and GAM337328

GR7576 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7576(GR7576) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7576 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7576 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7576 precursor DNA encodes GR7576 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7576 is located from position 101025636 to position 101025731 relative to chromosome chr11 on the `+` strand (chr is an abbreviation for chromosome).

GR7576 precursor RNA folds spatially, forming GR7576 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7576

folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7576 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7576 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM337338 precursor RNA, GAM337339 precursor RNA and GAM337340 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337338 RNA, GAM337339 RNA and GAM337340 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337338 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337338 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337338 target RNA into GAM337338 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337339 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337339 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337339 target RNA into GAM337339 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337340 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337340 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337340 target RNA into GAM337340 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7576 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7576 polynucleotide: GAM337338 target protein, GAM337339 target

protein and GAM337340 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337338, GAM337339 and GAM337340

GR7577 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7577(GR7577) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7577 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7577 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7577 precursor DNA encodes GR7577 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7577 is located from position 111418113 to position 111418192 relative to chromosome chr11 on the `+` strand (chr is an abbreviation for chromosome).

GR7577 precursor RNA folds spatially, forming GR7577 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7577 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7577 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7577 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337422 precursor RNA and GAM337423 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337422 RNA and GAM337423 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337422 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337422 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III

of Fig. 8, thereby inhibiting translation of GAM337422 target RNA into GAM337422 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337423 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337423 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337423 target RNA into GAM337423 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7577 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7577 polynucleotide: GAM337422 target protein and GAM337423 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337422 and GAM337423

GR7578 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7578(GR7578) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7578 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7578 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7578 precursor DNA encodes GR7578 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7578 is located from position 111702787 to position 111702870 relative to chromosome chr11 on the `+` strand (chr is an abbreviation for chromosome).

GR7578 precursor RNA folds spatially, forming GR7578 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7578 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7578 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7578 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337424 precursor RNA and GAM337425 precursor RNA,herein

schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337424 RNA and GAM337425 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337424 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337424 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337424 target RNA into GAM337424 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337425 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337425 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337425 target RNA into GAM337425 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7578 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7578 polynucleotide: GAM337424 target protein and GAM337425 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337424 and GAM337425

GR7579 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7579(GR7579) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7579 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7579 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7579 precursor DNA encodes GR7579 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7579 is located from position

113971966 to position 113972054 relative to chromosome chr11 on the `+` strand (chr is an abbreviation for chromosome).

GR7579 precursor RNA folds spatially, forming GR7579 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7579 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7579 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7579 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM4188 precursor RNA and GAM5623 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM4188 RNA and GAM5623 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM4188 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM4188 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM4188 target RNA into GAM4188 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM5623 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM5623 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM5623 target RNA into GAM5623 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7579 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7579 polynucleotide: GAM4188 target protein and GAM5623 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM4188 and GAM5623

GR7580 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7580(GR7580) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7580 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7580 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7580 precursor DNA encodes GR7580 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7580 is located from position 126234545 to position 126234647 relative to chromosome chr11 on the `+` strand (chr is an abbreviation for chromosome).

GR7580 precursor RNA folds spatially, forming GR7580 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7580 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7580 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7580 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337507 precursor RNA and GAM337508 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337507 RNA and GAM337508 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337507 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337507 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337507 target RNA into GAM337507 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337508 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an

untranslated region of GAM337508 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337508 target RNA into GAM337508 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7580 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7580 polynucleotide: GAM337507 target protein and GAM337508 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337507 and GAM337508

GR7581 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7581(GR7581) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7581 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7581 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7581 precursor DNA encodes GR7581 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7581 is located from position 18338801 to position 18338899 relative to chromosome chr11 on the `-` strand (chr is an abbreviation for chromosome).

GR7581 precursor RNA folds spatially, forming GR7581 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7581 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7581 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7581 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336443 precursor RNA and GAM336444 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER

COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336443 RNA and GAM336444 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336443 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336443 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336443 target RNA into GAM336443 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336444 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336444 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336444 target RNA into GAM336444 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7581 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7581 polynucleotide: GAM336443 target protein and GAM336444 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336443 and GAM336444

GR7582 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7582(GR7582) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7582 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7582 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7582 precursor DNA encodes GR7582 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7582 is located from position 46654581 to position 46654675 relative to chromosome chr11 on the `-` strand (chr is an abbreviation for chromosome).

GR7582 precursor RNA folds spatially, forming GR7582 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7582

folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7582 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7582 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336810 precursor RNA and GAM336811 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336810 RNA and GAM336811 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336810 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336810 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336810 target RNA into GAM336810 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336811 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336811 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336811 target RNA into GAM336811 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7582 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7582 polynucleotide: GAM336810 target protein and GAM336811 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336810 and GAM336811

GR7583 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7583(GR7583) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene

is known in the art.

GR7583 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7583 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7583 precursor DNA encodes GR7583 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7583 is located from position 3259659 to position 3259772 relative to chromosome chr12 on the `+` strand (chr is an abbreviation for chromosome).

GR7583 precursor RNA folds spatially, forming GR7583 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7583 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7583 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7583 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336268 precursor RNA and GAM336269 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336268 RNA and GAM336269 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336268 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336268 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336268 target RNA into GAM336268 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336269 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336269 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336269 target RNA into GAM336269 target protein, herein schematically represented by GAM1 TARGET PROTEIN through

GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7583 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7583 polynucleotide: GAM336268 target protein and GAM336269 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336268 and GAM336269

GR7584 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7584(GR7584) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7584 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7584 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7584 precursor DNA encodes GR7584 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7584 is located from position 50911119 to position 50911225 relative to chromosome chr12 on the `+` strand (chr is an abbreviation for chromosome).

GR7584 precursor RNA folds spatially, forming GR7584 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7584 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7584 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7584 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336876 precursor RNA and GAM336877 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336876 RNA and GAM336877 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336876 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336876 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336876 target RNA into GAM336876 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336877 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336877 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336877 target RNA into GAM336877 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7584 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7584 polynucleotide: GAM336876 target protein and GAM336877 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336876 and GAM336877

GR7585 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7585(GR7585) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7585 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7585 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7585 precursor DNA encodes GR7585 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7585 is located from position 57533860 to position 57533948 relative to chromosome chr12 on the `+` strand (chr is an abbreviation for chromosome).

GR7585 precursor RNA folds spatially, forming GR7585 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7585 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7585 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half

thereof, as is well known in the art.

GR7585 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336925 precursor RNA and GAM336926 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336925 RNA and GAM336926 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336925 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336925 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336925 target RNA into GAM336925 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336926 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336926 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336926 target RNA into GAM336926 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7585 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7585 polynucleotide: GAM336925 target protein and GAM336926 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336925 and GAM336926

GR7586 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7586(GR7586) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7586 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7586 precursor DNA was detected is described hereinabove with

additional reference to Figs. 8-18.

GR7586 precursor DNA encodes GR7586 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7586 is located from position 62689480 to position 62689572 relative to chromosome chr12 on the `+` strand (chr is an abbreviation for chromosome).

GR7586 precursor RNA folds spatially, forming GR7586 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7586 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7586 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7586 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336970 precursor RNA and GAM336971 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336970 RNA and GAM336971 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336970 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336970 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336970 target RNA into GAM336970 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336971 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336971 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336971 target RNA into GAM336971 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7586 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like`

cluster of GR7586 polynucleotide: GAM336970 target protein and GAM336971 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336970 and GAM336971

GR7587 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7587(GR7587) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7587 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7587 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7587 precursor DNA encodes GR7587 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7587 is located from position 66457769 to position 66457886 relative to chromosome chr12 on the `+` strand (chr is an abbreviation for chromosome).

GR7587 precursor RNA folds spatially, forming GR7587 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7587 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7587 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7587 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337032 precursor RNA and GAM337033 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337032 RNA and GAM337033 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337032 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337032 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III

of Fig. 8, thereby inhibiting translation of GAM337032 target RNA into GAM337032 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337033 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337033 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337033 target RNA into GAM337033 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7587 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7587 polynucleotide: GAM337032 target protein and GAM337033 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337032 and GAM337033

GR7588 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7588(GR7588) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7588 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7588 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7588 precursor DNA encodes GR7588 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7588 is located from position 85256084 to position 85256183 relative to chromosome chr12 on the `+` strand (chr is an abbreviation for chromosome).

GR7588 precursor RNA folds spatially, forming GR7588 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7588 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7588 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7588 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM337213 precursor RNA, GAM337214 precursor RNA and

GAM337215 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337213 RNA, GAM337214 RNA and GAM337215 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337213 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337213 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337213 target RNA into GAM337213 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337214 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337214 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337214 target RNA into GAM337214 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337215 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337215 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337215 target RNA into GAM337215 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7588 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7588 polynucleotide: GAM337213 target protein, GAM337214 target protein and GAM337215 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337213, GAM337214 and GAM337215

GR7589 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7589(GR7589) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene

is known in the art.

GR7589 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7589 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7589 precursor DNA encodes GR7589 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7589 is located from position 98930881 to position 98930977 relative to chromosome chr12 on the `+` strand (chr is an abbreviation for chromosome).

GR7589 precursor RNA folds spatially, forming GR7589 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7589 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7589 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7589 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337312 precursor RNA and GAM337313 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337312 RNA and GAM337313 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337312 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337312 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337312 target RNA into GAM337312 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337313 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337313 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337313 target RNA into GAM337313 target protein, herein schematically represented by GAM1 TARGET PROTEIN through

GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7589 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7589 polynucleotide: GAM337312 target protein and GAM337313 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337312 and GAM337313

GR7590 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7590(GR7590) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7590 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7590 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7590 precursor DNA encodes GR7590 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7590 is located from position 99096789 to position 99096892 relative to chromosome chr12 on the `+` strand (chr is an abbreviation for chromosome).

GR7590 precursor RNA folds spatially, forming GR7590 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7590 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7590 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7590 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM337317 precursor RNA, GAM337318 precursor RNA and GAM337319 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337317 RNA, GAM337318 RNA and GAM337319 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337317 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337317 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337317 target RNA into GAM337317 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337318 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337318 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337318 target RNA into GAM337318 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337319 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337319 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337319 target RNA into GAM337319 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7590 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7590 polynucleotide: GAM337317 target protein, GAM337318 target protein and GAM337319 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337317, GAM337318 and GAM337319

GR7591 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7591(GR7591) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7591 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7591 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7591 precursor DNA encodes GR7591 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7591 is located from position

118768041 to position 118768122 relative to chromosome chr12 on the `+` strand (chr is an abbreviation for chromosome).

GR7591 precursor RNA folds spatially, forming GR7591 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7591 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7591 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7591 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM3978 precursor RNA and GAM5048 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM3978 RNA and GAM5048 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM3978 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM3978 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM3978 target RNA into GAM3978 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM5048 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM5048 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM5048 target RNA into GAM5048 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7591 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7591 polynucleotide: GAM3978 target protein and GAM5048 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM3978 and GAM5048

GR7592 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7592(GR7592) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7592 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7592 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7592 precursor DNA encodes GR7592 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7592 is located from position 49044659 to position 49044769 relative to chromosome chr12 on the `-` strand (chr is an abbreviation for chromosome).

GR7592 precursor RNA folds spatially, forming GR7592 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7592 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7592 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7592 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336848 precursor RNA and GAM336849 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336848 RNA and GAM336849 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336848 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336848 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336848 target RNA into GAM336848 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336849 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an

untranslated region of GAM336849 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336849 target RNA into GAM336849 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7592 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7592 polynucleotide: GAM336848 target protein and GAM336849 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336848 and GAM336849

GR7593 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7593(GR7593) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7593 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7593 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7593 precursor DNA encodes GR7593 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7593 is located from position 68796420 to position 68796544 relative to chromosome chr12 on the `-` strand (chr is an abbreviation for chromosome).

GR7593 precursor RNA folds spatially, forming GR7593 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7593 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7593 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7593 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 4 separate GAM precursor RNAs, GAM337055 precursor RNA, GAM337056 precursor RNA, GAM337057 precursor RNA and GAM337058 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337055 RNA, GAM337056 RNA, GAM337057 RNA and GAM337058 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337055 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337055 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337055 target RNA into GAM337055 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337056 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337056 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337056 target RNA into GAM337056 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337057 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337057 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337057 target RNA into GAM337057 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337058 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337058 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337058 target RNA into GAM337058 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7593 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7593 polynucleotide: GAM337055 target protein, GAM337056 target protein, GAM337057 target protein and GAM337058 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337055, GAM337056, GAM337057 and GAM337058

GR7594 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record

7594(GR7594) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7594 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7594 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7594 precursor DNA encodes GR7594 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7594 is located from position 112469045 to position 112469166 relative to chromosome chr12 on the `-` strand (chr is an abbreviation for chromosome).

GR7594 precursor RNA folds spatially, forming GR7594 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7594 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7594 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7594 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 4 separate GAM precursor RNAs, GAM337430 precursor RNA, GAM337431 precursor RNA, GAM337432 precursor RNA and GAM337433 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337430 RNA, GAM337431 RNA, GAM337432 RNA and GAM337433 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337430 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337430 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337430 target RNA into GAM337430 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337431 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337431 target RNA, herein schematically represented by

GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337431 target RNA into GAM337431 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337432 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337432 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337432 target RNA into GAM337432 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337433 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337433 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337433 target RNA into GAM337433 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7594 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7594 polynucleotide: GAM337430 target protein, GAM337431 target protein, GAM337432 target protein and GAM337433 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337430, GAM337431, GAM337432 and GAM337433

GR7595 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7595(GR7595) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7595 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7595 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7595 precursor DNA encodes GR7595 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7595 is located from position 116582532 to position 116582633 relative to chromosome chr12 on the `-` strand (chr is an abbreviation for chromosome).

GR7595 precursor RNA folds spatially, forming GR7595 folded precursor

RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7595 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7595 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7595 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337456 precursor RNA and GAM337457 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337456 RNA and GAM337457 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337456 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337456 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337456 target RNA into GAM337456 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337457 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337457 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337457 target RNA into GAM337457 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7595 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7595 polynucleotide: GAM337456 target protein and GAM337457 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337456 and GAM337457

GR7596 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7596(GR7596) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at

least one target gene, the function and utility of which at least one target gene is known in the art.

GR7596 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7596 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7596 precursor DNA encodes GR7596 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7596 is located from position 123732628 to position 123734295 relative to chromosome chr12 on the `-` strand (chr is an abbreviation for chromosome).

GR7596 precursor RNA folds spatially, forming GR7596 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7596 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7596 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7596 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337494 precursor RNA and GAM337495 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337494 RNA and GAM337495 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337494 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337494 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337494 target RNA into GAM337494 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337495 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337495 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337495 target RNA into GAM337495

target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7596 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7596 polynucleotide: GAM337494 target protein and GAM337495 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337494 and GAM337495

GR7597 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7597(GR7597) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7597 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7597 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7597 precursor DNA encodes GR7597 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7597 is located from position 132911257 to position 132911356 relative to chromosome chr12 on the `-` strand (chr is an abbreviation for chromosome).

GR7597 precursor RNA folds spatially, forming GR7597 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7597 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7597 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7597 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337555 precursor RNA and GAM337556 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337555 RNA and GAM337556 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337555 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337555 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337555 target RNA into GAM337555 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337556 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337556 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337556 target RNA into GAM337556 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7597 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7597 polynucleotide: GAM337555 target protein and GAM337556 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337555 and GAM337556

GR7598 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7598(GR7598) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7598 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7598 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7598 precursor DNA encodes GR7598 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7598 is located from position 96668219 to position 96668344 relative to chromosome chr13 on the `-` strand (chr is an abbreviation for chromosome).

GR7598 precursor RNA folds spatially, forming GR7598 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7598 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7598 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at

least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7598 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337285 precursor RNA and GAM337286 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337285 RNA and GAM337286 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337285 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337285 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337285 target RNA into GAM337285 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337286 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337286 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337286 target RNA into GAM337286 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7598 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7598 polynucleotide: GAM337285 target protein and GAM337286 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337285 and GAM337286

GR7599 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7599(GR7599) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7599 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The

method by which GR7599 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7599 precursor DNA encodes GR7599 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7599 is located from position 101658818 to position 101658892 relative to chromosome chr13 on the `-` strand (chr is an abbreviation for chromosome).

GR7599 precursor RNA folds spatially, forming GR7599 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7599 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7599 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7599 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337353 precursor RNA and GAM337354 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337353 RNA and GAM337354 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337353 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337353 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337353 target RNA into GAM337353 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337354 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337354 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337354 target RNA into GAM337354 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7599 polynucleotide correlate with, and may be deduced from, the identity of

the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7599 polynucleotide: GAM337353 target protein and GAM337354 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337353 and GAM337354

GR7600 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7600(GR7600) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7600 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7600 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7600 precursor DNA encodes GR7600 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7600 is located from position 79670251 to position 79670337 relative to chromosome chr14 on the `+` strand (chr is an abbreviation for chromosome).

GR7600 precursor RNA folds spatially, forming GR7600 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7600 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7600 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7600 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1820 precursor RNA and GAM3595 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1820 RNA and GAM3595 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM1820 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM1820 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1820 target RNA into GAM1820 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM3595 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM3595 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM3595 target RNA into GAM3595 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7600 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7600 polynucleotide: GAM1820 target protein and GAM3595 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM1820 and GAM3595

GR7601 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7601(GR7601) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7601 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7601 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7601 precursor DNA encodes GR7601 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7601 is located from position 66268768 to position 66268872 relative to chromosome chr14 on the `-` strand (chr is an abbreviation for chromosome).

GR7601 precursor RNA folds spatially, forming GR7601 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7601 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7601 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7601 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate

GAM precursor RNAs, GAM337029 precursor RNA and GAM337030 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337029 RNA and GAM337030 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337029 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337029 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337029 target RNA into GAM337029 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337030 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337030 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337030 target RNA into GAM337030 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7601 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7601 polynucleotide: GAM337029 target protein and GAM337030 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337029 and GAM337030

GR7602 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7602(GR7602) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7602 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7602 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7602 precursor DNA encodes GR7602 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand

nucleotides long. Nucleotide sequence of GR7602 is located from position 101964516 to position 101964622 relative to chromosome chr14 on the `-` strand (chr is an abbreviation for chromosome).

GR7602 precursor RNA folds spatially, forming GR7602 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7602 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7602 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7602 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337358 precursor RNA and GAM337359 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337358 RNA and GAM337359 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337358 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337358 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337358 target RNA into GAM337358 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337359 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337359 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337359 target RNA into GAM337359 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7602 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7602 polynucleotide: GAM337358 target protein and GAM337359 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337358 and GAM337359

GR7603 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7603(GR7603) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7603 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7603 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7603 precursor DNA encodes GR7603 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7603 is located from position 104342178 to position 104342289 relative to chromosome chr14 on the `-` strand (chr is an abbreviation for chromosome).

GR7603 precursor RNA folds spatially, forming GR7603 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7603 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7603 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7603 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337367 precursor RNA and GAM337368 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337367 RNA and GAM337368 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337367 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337367 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337367 target RNA into GAM337367 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337368 RNA, herein schematically represented by GAM1 RNA through

GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337368 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337368 target RNA into GAM337368 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7603 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7603 polynucleotide: GAM337367 target protein and GAM337368 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337367 and GAM337368

GR7604 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7604(GR7604) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7604 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7604 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7604 precursor DNA encodes GR7604 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7604 is located from position 30068447 to position 30068569 relative to chromosome chr15 on the `+` strand (chr is an abbreviation for chromosome).

GR7604 precursor RNA folds spatially, forming GR7604 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7604 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7604 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7604 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336593 precursor RNA and GAM336594 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336593 RNA and GAM336594 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336593 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336593 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336593 target RNA into GAM336593 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336594 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336594 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336594 target RNA into GAM336594 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7604 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7604 polynucleotide: GAM336593 target protein and GAM336594 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336593 and GAM336594

GR7605 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7605(GR7605) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7605 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7605 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7605 precursor DNA encodes GR7605 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7605 is located from position 33981295 to position 33981407 relative to chromosome chr15 on the `+` strand (chr is an abbreviation for chromosome).

GR7605 precursor RNA folds spatially, forming GR7605 folded precursor

RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7605 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7605 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7605 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM3138 precursor RNA and GAM7255 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM3138 RNA and GAM7255 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM3138 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM3138 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM3138 target RNA into GAM3138 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM7255 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM7255 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM7255 target RNA into GAM7255 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7605 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7605 polynucleotide: GAM3138 target protein and GAM7255 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM3138 and GAM7255

GR7606 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7606(GR7606) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at

least one target gene, the function and utility of which at least one target gene is known in the art.

GR7606 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7606 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7606 precursor DNA encodes GR7606 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7606 is located from position 43562097 to position 43562227 relative to chromosome chr15 on the `+` strand (chr is an abbreviation for chromosome).

GR7606 precursor RNA folds spatially, forming GR7606 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7606 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7606 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7606 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM593 precursor RNA and GAM8362 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM593 RNA and GAM8362 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM593 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM593 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM593 target RNA into GAM593 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM8362 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM8362 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM8362 target RNA into GAM8362 target

protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7606 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7606 polynucleotide: GAM593 target protein and GAM8362 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM593 and GAM8362

GR7607 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7607(GR7607) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7607 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7607 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7607 precursor DNA encodes GR7607 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7607 is located from position 56876889 to position 56877003 relative to chromosome chr15 on the `+` strand (chr is an abbreviation for chromosome).

GR7607 precursor RNA folds spatially, forming GR7607 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7607 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7607 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7607 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336917 precursor RNA and GAM336918 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336917 RNA and GAM336918 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336917 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336917 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336917 target RNA into GAM336917 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336918 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336918 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336918 target RNA into GAM336918 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7607 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7607 polynucleotide: GAM336917 target protein and GAM336918 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336917 and GAM336918

GR7608 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7608(GR7608) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7608 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7608 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7608 precursor DNA encodes GR7608 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7608 is located from position 71953198 to position 71953292 relative to chromosome chr15 on the `+` strand (chr is an abbreviation for chromosome).

GR7608 precursor RNA folds spatially, forming GR7608 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7608 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7608 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at

least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7608 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337103 precursor RNA and GAM337104 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337103 RNA and GAM337104 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337103 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337103 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337103 target RNA into GAM337103 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337104 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337104 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337104 target RNA into GAM337104 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7608 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7608 polynucleotide: GAM337103 target protein and GAM337104 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337103 and GAM337104

GR7609 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7609(GR7609) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7609 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The

method by which GR7609 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7609 precursor DNA encodes GR7609 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7609 is located from position 87034877 to position 87035504 relative to chromosome chr15 on the `+` strand (chr is an abbreviation for chromosome).

GR7609 precursor RNA folds spatially, forming GR7609 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7609 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7609 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7609 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337219 precursor RNA and GAM337220 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337219 RNA and GAM337220 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337219 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337219 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337219 target RNA into GAM337219 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337220 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337220 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337220 target RNA into GAM337220 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7609 polynucleotide correlate with, and may be deduced from, the identity of

the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7609 polynucleotide: GAM337219 target protein and GAM337220 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337219 and GAM337220

GR7610 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7610(GR7610) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7610 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7610 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7610 precursor DNA encodes GR7610 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7610 is located from position 97153223 to position 97153320 relative to chromosome chr15 on the `+` strand (chr is an abbreviation for chromosome).

GR7610 precursor RNA folds spatially, forming GR7610 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7610 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7610 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7610 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337293 precursor RNA and GAM337294 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337293 RNA and GAM337294 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337293 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337293 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to

a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337293 target RNA into GAM337293 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337294 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337294 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337294 target RNA into GAM337294 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7610 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7610 polynucleotide: GAM337293 target protein and GAM337294 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337293 and GAM337294

GR7611 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7611(GR7611) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7611 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7611 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7611 precursor DNA encodes GR7611 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7611 is located from position 28205837 to position 28205959 relative to chromosome chr15 on the `-` strand (chr is an abbreviation for chromosome).

GR7611 precursor RNA folds spatially, forming GR7611 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7611 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7611 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7611 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate

GAM precursor RNAs, GAM550 precursor RNA and GAM6161 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM550 RNA and GAM6161 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM550 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM550 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM550 target RNA into GAM550 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM6161 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM6161 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM6161 target RNA into GAM6161 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7611 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7611 polynucleotide: GAM550 target protein and GAM6161 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM550 and GAM6161

GR7612 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7612(GR7612) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7612 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7612 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7612 precursor DNA encodes GR7612 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand

nucleotides long. Nucleotide sequence of GR7612 is located from position 70520489 to position 70520583 relative to chromosome chr15 on the `-` strand (chr is an abbreviation for chromosome).

GR7612 precursor RNA folds spatially, forming GR7612 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7612 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7612 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7612 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337085 precursor RNA and GAM337086 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337085 RNA and GAM337086 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337085 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337085 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337085 target RNA into GAM337085 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337086 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337086 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337086 target RNA into GAM337086 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7612 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7612 polynucleotide: GAM337085 target protein and GAM337086 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337085 and GAM337086

GR7613 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7613(GR7613) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7613 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7613 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7613 precursor DNA encodes GR7613 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7613 is located from position 73124349 to position 73124443 relative to chromosome chr15 on the `-` strand (chr is an abbreviation for chromosome).

GR7613 precursor RNA folds spatially, forming GR7613 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7613 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7613 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7613 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337121 precursor RNA and GAM337122 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337121 RNA and GAM337122 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337121 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337121 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337121 target RNA into GAM337121 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337122 RNA, herein schematically represented by GAM1 RNA through

GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337122 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337122 target RNA into GAM337122 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7613 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7613 polynucleotide: GAM337121 target protein and GAM337122 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337121 and GAM337122

GR7614 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7614(GR7614) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7614 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7614 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7614 precursor DNA encodes GR7614 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7614 is located from position 73148626 to position 73148720 relative to chromosome chr15 on the `-` strand (chr is an abbreviation for chromosome).

GR7614 precursor RNA folds spatially, forming GR7614 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7614 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7614 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7614 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337124 precursor RNA and GAM337125 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337124 RNA and GAM337125 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337124 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337124 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337124 target RNA into GAM337124 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337125 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337125 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337125 target RNA into GAM337125 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7614 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7614 polynucleotide: GAM337124 target protein and GAM337125 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337124 and GAM337125

GR7615 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7615(GR7615) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7615 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7615 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7615 precursor DNA encodes GR7615 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7615 is located from position 12103390 to position 12103474 relative to chromosome chr16 on the `+` strand (chr is an abbreviation for chromosome).

GR7615 precursor RNA folds spatially, forming GR7615 folded precursor

RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7615 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7615 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7615 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336380 precursor RNA and GAM336381 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336380 RNA and GAM336381 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336380 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336380 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336380 target RNA into GAM336380 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336381 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336381 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336381 target RNA into GAM336381 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7615 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7615 polynucleotide: GAM336380 target protein and GAM336381 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336380 and GAM336381

GR7616 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7616(GR7616) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at

least one target gene, the function and utility of which at least one target gene is known in the art.

GR7616 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7616 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7616 precursor DNA encodes GR7616 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7616 is located from position 13863781 to position 13863883 relative to chromosome chr16 on the `+` strand (chr is an abbreviation for chromosome).

GR7616 precursor RNA folds spatially, forming GR7616 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7616 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7616 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7616 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336401 precursor RNA and GAM336402 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336401 RNA and GAM336402 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336401 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336401 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336401 target RNA into GAM336401 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336402 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336402 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336402 target RNA into GAM336402

target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7616 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7616 polynucleotide: GAM336401 target protein and GAM336402 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336401 and GAM336402

GR7617 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7617(GR7617) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7617 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7617 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7617 precursor DNA encodes GR7617 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7617 is located from position 15740561 to position 15740653 relative to chromosome chr16 on the `+` strand (chr is an abbreviation for chromosome).

GR7617 precursor RNA folds spatially, forming GR7617 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7617 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7617 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7617 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336415 precursor RNA and GAM336416 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336415 RNA and GAM336416 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336415 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336415 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336415 target RNA into GAM336415 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336416 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336416 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336416 target RNA into GAM336416 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7617 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7617 polynucleotide: GAM336415 target protein and GAM336416 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336415 and GAM336416

GR7618 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7618(GR7618) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7618 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7618 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7618 precursor DNA encodes GR7618 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7618 is located from position 30012807 to position 30012916 relative to chromosome chr16 on the `+` strand (chr is an abbreviation for chromosome).

GR7618 precursor RNA folds spatially, forming GR7618 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7618 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7618 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at

least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7618 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM1698 precursor RNA and GAM5998 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1698 RNA and GAM5998 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM1698 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM1698 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1698 target RNA into GAM1698 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM5998 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM5998 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM5998 target RNA into GAM5998 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7618 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7618 polynucleotide: GAM1698 target protein and GAM5998 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM1698 and GAM5998

GR7619 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7619(GR7619) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7619 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The

method by which GR7619 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7619 precursor DNA encodes GR7619 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7619 is located from position 47073422 to position 47073513 relative to chromosome chr16 on the `+` strand (chr is an abbreviation for chromosome).

GR7619 precursor RNA folds spatially, forming GR7619 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7619 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7619 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7619 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336816 precursor RNA and GAM336817 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336816 RNA and GAM336817 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336816 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336816 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336816 target RNA into GAM336816 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336817 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336817 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336817 target RNA into GAM336817 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7619 polynucleotide correlate with, and may be deduced from, the identity of

the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7619 polynucleotide: GAM336816 target protein and GAM336817 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336816 and GAM336817

GR7620 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7620(GR7620) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7620 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7620 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7620 precursor DNA encodes GR7620 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7620 is located from position 69762447 to position 69762558 relative to chromosome chr16 on the `+` strand (chr is an abbreviation for chromosome).

GR7620 precursor RNA folds spatially, forming GR7620 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7620 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7620 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7620 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 4 separate GAM precursor RNAs, GAM1216 precursor RNA, GAM3479 precursor RNA, GAM7140 precursor RNA and GAM7415 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1216 RNA, GAM3479 RNA, GAM7140 RNA and GAM7415 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM1216 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM1216 target RNA, herein schematically represented by GAM1 TARGET RNA

through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1216 target RNA into GAM1216 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM3479 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM3479 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM3479 target RNA into GAM3479 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM7140 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM7140 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM7140 target RNA into GAM7140 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM7415 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM7415 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM7415 target RNA into GAM7415 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7620 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7620 polynucleotide: GAM1216 target protein, GAM3479 target protein, GAM7140 target protein and GAM7415 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM1216, GAM3479, GAM7140 and GAM7415

GR7621 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7621(GR7621) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7621 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7621 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7621 precursor DNA encodes GR7621 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7621 is located from position 70140212 to position 70140313 relative to chromosome chr16 on the `+` strand (chr is an abbreviation for chromosome).

GR7621 precursor RNA folds spatially, forming GR7621 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7621 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7621 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7621 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM337074 precursor RNA, GAM337075 precursor RNA and GAM337076 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337074 RNA, GAM337075 RNA and GAM337076 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337074 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337074 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337074 target RNA into GAM337074 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337075 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337075 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337075 target RNA into GAM337075 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337076 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337076 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to

a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337076 target RNA into GAM337076 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7621 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7621 polynucleotide: GAM337074 target protein, GAM337075 target protein and GAM337076 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337074, GAM337075 and GAM337076

GR7622 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7622(GR7622) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7622 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7622 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7622 precursor DNA encodes GR7622 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7622 is located from position 75288695 to position 75288820 relative to chromosome chr16 on the `+` strand (chr is an abbreviation for chromosome).

GR7622 precursor RNA folds spatially, forming GR7622 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7622 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7622 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7622 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM4315 precursor RNA and GAM7124 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides

in length, GAM4315 RNA and GAM7124 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM4315 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM4315 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM4315 target RNA into GAM4315 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM7124 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM7124 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM7124 target RNA into GAM7124 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7622 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7622 polynucleotide: GAM4315 target protein and GAM7124 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM4315 and GAM7124

GR7623 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7623(GR7623) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7623 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7623 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7623 precursor DNA encodes GR7623 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7623 is located from position 77109458 to position 77109568 relative to chromosome chr16 on the `+` strand (chr is an abbreviation for chromosome).

GR7623 precursor RNA folds spatially, forming GR7623 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7623 folded precursor RNA comprises a plurality of what is known in the art as

`hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7623 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7623 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337180 precursor RNA and GAM337181 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337180 RNA and GAM337181 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337180 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337180 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337180 target RNA into GAM337180 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337181 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337181 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337181 target RNA into GAM337181 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7623 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7623 polynucleotide: GAM337180 target protein and GAM337181 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337180 and GAM337181

GR7624 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7624(GR7624) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7624 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7624 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7624 precursor DNA encodes GR7624 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7624 is located from position 11968201 to position 11968286 relative to chromosome chr16 on the `-` strand (chr is an abbreviation for chromosome).

GR7624 precursor RNA folds spatially, forming GR7624 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7624 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7624 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7624 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336376 precursor RNA and GAM336377 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336376 RNA and GAM336377 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336376 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336376 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336376 target RNA into GAM336376 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336377 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336377 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336377 target RNA into GAM336377 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7624 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7624 polynucleotide: GAM336376 target protein and GAM336377 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336376 and GAM336377

GR7625 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7625(GR7625) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7625 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7625 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7625 precursor DNA encodes GR7625 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7625 is located from position 34908023 to position 34908122 relative to chromosome chr16 on the `-` strand (chr is an abbreviation for chromosome).

GR7625 precursor RNA folds spatially, forming GR7625 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7625 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7625 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7625 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336654 precursor RNA and GAM336655 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336654 RNA and GAM336655 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336654 RNA, herein schematically represented by GAM1 RNA through

GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336654 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336654 target RNA into GAM336654 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336655 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336655 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336655 target RNA into GAM336655 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7625 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7625 polynucleotide: GAM336654 target protein and GAM336655 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336654 and GAM336655

GR7626 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7626(GR7626) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7626 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7626 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7626 precursor DNA encodes GR7626 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7626 is located from position 48164886 to position 48165017 relative to chromosome chr16 on the `-` strand (chr is an abbreviation for chromosome).

GR7626 precursor RNA folds spatially, forming GR7626 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7626 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7626 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7626 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336833 precursor RNA and GAM336834 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336833 RNA and GAM336834 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336833 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336833 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336833 target RNA into GAM336833 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336834 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336834 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336834 target RNA into GAM336834 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7626 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7626 polynucleotide: GAM336833 target protein and GAM336834 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336833 and GAM336834

GR7627 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7627(GR7627) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7627 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7627 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7627 precursor DNA encodes GR7627 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7627 is located from position 1228075 to position 1228162 relative to chromosome chr17 on the `+` strand (chr is an abbreviation for chromosome).

GR7627 precursor RNA folds spatially, forming GR7627 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7627 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7627 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7627 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336255 precursor RNA and GAM336256 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336255 RNA and GAM336256 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336255 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336255 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336255 target RNA into GAM336255 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336256 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336256 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336256 target RNA into GAM336256 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7627 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7627 polynucleotide: GAM336255 target protein and GAM336256 target

protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336255 and GAM336256

GR7628 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7628(GR7628) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7628 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7628 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7628 precursor DNA encodes GR7628 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7628 is located from position 4444093 to position 4444184 relative to chromosome chr17 on the `+` strand (chr is an abbreviation for chromosome).

GR7628 precursor RNA folds spatially, forming GR7628 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7628 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7628 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7628 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336282 precursor RNA and GAM336283 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336282 RNA and GAM336283 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336282 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336282 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336282 target RNA into GAM336282

target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336283 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336283 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336283 target RNA into GAM336283 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7628 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7628 polynucleotide: GAM336282 target protein and GAM336283 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336282 and GAM336283

GR7629 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7629(GR7629) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7629 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7629 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7629 precursor DNA encodes GR7629 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7629 is located from position 8370724 to position 8370825 relative to chromosome chr17 on the `+` strand (chr is an abbreviation for chromosome).

GR7629 precursor RNA folds spatially, forming GR7629 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7629 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7629 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7629 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336320 precursor RNA and GAM336321 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED

PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336320 RNA and GAM336321 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336320 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336320 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336320 target RNA into GAM336320 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336321 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336321 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336321 target RNA into GAM336321 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7629 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7629 polynucleotide: GAM336320 target protein and GAM336321 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336320 and GAM336321

GR7630 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7630(GR7630) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7630 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7630 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7630 precursor DNA encodes GR7630 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7630 is located from position 11236576 to position 11236663 relative to chromosome chr17 on the `+` strand (chr is an

abbreviation for chromosome).

GR7630 precursor RNA folds spatially, forming GR7630 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7630 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7630 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7630 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336366 precursor RNA and GAM336367 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336366 RNA and GAM336367 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336366 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336366 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336366 target RNA into GAM336366 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336367 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336367 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336367 target RNA into GAM336367 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7630 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7630 polynucleotide: GAM336366 target protein and GAM336367 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336366 and GAM336367

GR7631 Fig. 16 further provides a conceptual description of novel bioinformatically

detected regulatory polynucleotide, referred to here as Genomic Record 7631(GR7631) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7631 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7631 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7631 precursor DNA encodes GR7631 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7631 is located from position 28064331 to position 28064436 relative to chromosome chr17 on the `+` strand (chr is an abbreviation for chromosome).

GR7631 precursor RNA folds spatially, forming GR7631 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7631 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7631 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7631 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM336567 precursor RNA, GAM336568 precursor RNA and GAM336569 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336567 RNA, GAM336568 RNA and GAM336569 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336567 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336567 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336567 target RNA into GAM336567 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336568 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an

untranslated region of GAM336568 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336568 target RNA into GAM336568 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336569 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336569 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336569 target RNA into GAM336569 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7631 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7631 polynucleotide: GAM336567 target protein, GAM336568 target protein and GAM336569 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336567, GAM336568 and GAM336569

GR7632 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7632(GR7632) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7632 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7632 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7632 precursor DNA encodes GR7632 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7632 is located from position 29086596 to position 29086708 relative to chromosome chr17 on the `+` strand (chr is an abbreviation for chromosome).

GR7632 precursor RNA folds spatially, forming GR7632 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7632 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7632 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7632 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336583 precursor RNA and GAM336584 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336583 RNA and GAM336584 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336583 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336583 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336583 target RNA into GAM336583 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336584 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336584 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336584 target RNA into GAM336584 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7632 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7632 polynucleotide: GAM336583 target protein and GAM336584 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336583 and GAM336584

GR7633 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7633(GR7633) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7633 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7633 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7633 precursor DNA encodes GR7633 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7633 is located from position 33138955 to position 33139064 relative to chromosome chr17 on the `+` strand (chr is an abbreviation for chromosome).

GR7633 precursor RNA folds spatially, forming GR7633 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7633 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7633 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7633 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336628 precursor RNA and GAM336629 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336628 RNA and GAM336629 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336628 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336628 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336628 target RNA into GAM336628 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336629 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336629 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336629 target RNA into GAM336629 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7633 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7633 polynucleotide: GAM336628 target protein and GAM336629 target

protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336628 and GAM336629

GR7634 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7634(GR7634) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7634 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7634 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7634 precursor DNA encodes GR7634 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7634 is located from position 38591279 to position 38591402 relative to chromosome chr17 on the `+` strand (chr is an abbreviation for chromosome).

GR7634 precursor RNA folds spatially, forming GR7634 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7634 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7634 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7634 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM1653 precursor RNA, GAM1770 precursor RNA and GAM3140 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1653 RNA, GAM1770 RNA and GAM3140 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM1653 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM1653 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.

8, thereby inhibiting translation of GAM1653 target RNA into GAM1653 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM1770 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM1770 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1770 target RNA into GAM1770 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM3140 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM3140 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM3140 target RNA into GAM3140 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7634 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7634 polynucleotide: GAM1653 target protein, GAM1770 target protein and GAM3140 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM1653, GAM1770 and GAM3140

GR7635 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7635(GR7635) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7635 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7635 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7635 precursor DNA encodes GR7635 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7635 is located from position 57181803 to position 57181904 relative to chromosome chr17 on the `+` strand (chr is an abbreviation for chromosome).

GR7635 precursor RNA folds spatially, forming GR7635 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7635 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the

nucleotide sequence of GR7635 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7635 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336921 precursor RNA and GAM336922 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336921 RNA and GAM336922 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336921 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336921 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336921 target RNA into GAM336921 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336922 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336922 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336922 target RNA into GAM336922 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7635 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7635 polynucleotide: GAM336921 target protein and GAM336922 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336921 and GAM336922

GR7636 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7636(GR7636) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7636 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7636 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7636 precursor DNA encodes GR7636 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7636 is located from position 58596055 to position 58596161 relative to chromosome chr17 on the `+` strand (chr is an abbreviation for chromosome).

GR7636 precursor RNA folds spatially, forming GR7636 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7636 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7636 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7636 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336937 precursor RNA and GAM336938 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336937 RNA and GAM336938 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336937 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336937 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336937 target RNA into GAM336937 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336938 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336938 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336938 target RNA into GAM336938 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7636 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7636 polynucleotide: GAM336937 target protein and GAM336938 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336937 and GAM336938

GR7637 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7637(GR7637) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7637 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7637 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7637 precursor DNA encodes GR7637 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7637 is located from position 80018909 to position 80019009 relative to chromosome chr17 on the `+` strand (chr is an abbreviation for chromosome).

GR7637 precursor RNA folds spatially, forming GR7637 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7637 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7637 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7637 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337194 precursor RNA and GAM337195 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337194 RNA and GAM337195 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337194 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an

untranslated region of GAM337194 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337194 target RNA into GAM337194 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337195 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337195 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337195 target RNA into GAM337195 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7637 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7637 polynucleotide: GAM337194 target protein and GAM337195 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337194 and GAM337195

GR7638 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7638(GR7638) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7638 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7638 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7638 precursor DNA encodes GR7638 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7638 is located from position 28958697 to position 28958797 relative to chromosome chr17 on the `-` strand (chr is an abbreviation for chromosome).

GR7638 precursor RNA folds spatially, forming GR7638 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7638 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7638 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7638 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336578 precursor RNA and GAM336579 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336578 RNA and GAM336579 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336578 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336578 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336578 target RNA into GAM336578 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336579 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336579 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336579 target RNA into GAM336579 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7638 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7638 polynucleotide: GAM336578 target protein and GAM336579 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336578 and GAM336579

GR7639 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7639(GR7639) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7639 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7639 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7639 precursor DNA encodes GR7639 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7639 is located from position 39774112 to position 39774222 relative to chromosome chr17 on the `-` strand (chr is an abbreviation for chromosome).

GR7639 precursor RNA folds spatially, forming GR7639 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7639 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7639 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7639 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336711 precursor RNA and GAM336712 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336711 RNA and GAM336712 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336711 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336711 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336711 target RNA into GAM336711 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336712 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336712 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336712 target RNA into GAM336712 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7639 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7639 polynucleotide: GAM336711 target protein and GAM336712 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3

TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336711 and GAM336712

GR7640 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7640(GR7640) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7640 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7640 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7640 precursor DNA encodes GR7640 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7640 is located from position 76740959 to position 76741503 relative to chromosome chr17 on the `-` strand (chr is an abbreviation for chromosome).

GR7640 precursor RNA folds spatially, forming GR7640 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7640 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7640 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7640 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337176 precursor RNA and GAM337177 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337176 RNA and GAM337177 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337176 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337176 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337176 target RNA into GAM337176 target protein, herein schematically represented by GAM1 TARGET PROTEIN through

GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337177 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337177 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337177 target RNA into GAM337177 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7640 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7640 polynucleotide: GAM337176 target protein and GAM337177 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337176 and GAM337177

GR7641 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7641(GR7641) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7641 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7641 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7641 precursor DNA encodes GR7641 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7641 is located from position 18960647 to position 18960761 relative to chromosome chr18 on the `+` strand (chr is an abbreviation for chromosome).

GR7641 precursor RNA folds spatially, forming GR7641 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7641 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7641 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7641 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336451 precursor RNA and GAM336452 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA

segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336451 RNA and GAM336452 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336451 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336451 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336451 target RNA into GAM336451 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336452 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336452 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336452 target RNA into GAM336452 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7641 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7641 polynucleotide: GAM336451 target protein and GAM336452 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336451 and GAM336452

GR7642 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7642(GR7642) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7642 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7642 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7642 precursor DNA encodes GR7642 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7642 is located from position 61092534 to position 61092629 relative to chromosome chr18 on the `+` strand (chr is an abbreviation for chromosome).

GR7642 precursor RNA folds spatially, forming GR7642 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7642 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7642 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7642 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336952 precursor RNA and GAM336953 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336952 RNA and GAM336953 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336952 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336952 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336952 target RNA into GAM336952 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336953 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336953 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336953 target RNA into GAM336953 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7642 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7642 polynucleotide: GAM336952 target protein and GAM336953 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336952 and GAM336953

GR7643 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record

7643(GR7643) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7643 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7643 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7643 precursor DNA encodes GR7643 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7643 is located from position 6790508 to position 6790611 relative to chromosome chr19 on the `+` strand (chr is an abbreviation for chromosome).

GR7643 precursor RNA folds spatially, forming GR7643 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7643 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7643 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7643 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336306 precursor RNA and GAM336307 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336306 RNA and GAM336307 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336306 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336306 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336306 target RNA into GAM336306 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336307 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336307 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to

a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336307 target RNA into GAM336307 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7643 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7643 polynucleotide: GAM336306 target protein and GAM336307 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336306 and GAM336307

GR7644 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7644(GR7644) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7644 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7644 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7644 precursor DNA encodes GR7644 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7644 is located from position 44650568 to position 44650652 relative to chromosome chr19 on the `+` strand (chr is an abbreviation for chromosome).

GR7644 precursor RNA folds spatially, forming GR7644 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7644 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7644 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7644 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM3990 precursor RNA and GAM6994 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM3990 RNA and GAM6994 RNA, herein schematically represented by GAM1

RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM3990 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM3990 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM3990 target RNA into GAM3990 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM6994 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM6994 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM6994 target RNA into GAM6994 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7644 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7644 polynucleotide: GAM3990 target protein and GAM6994 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM3990 and GAM6994

GR7645 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7645(GR7645) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7645 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7645 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7645 precursor DNA encodes GR7645 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7645 is located from position 50818294 to position 50818398 relative to chromosome chr19 on the `+` strand (chr is an abbreviation for chromosome).

GR7645 precursor RNA folds spatially, forming GR7645 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7645 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the

nucleotide sequence of GR7645 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7645 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 4 separate GAM precursor RNAs, GAM354 precursor RNA, GAM569 precursor RNA, GAM821 precursor RNA and GAM2911 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM354 RNA, GAM569 RNA, GAM821 RNA and GAM2911 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM354 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM354 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM354 target RNA into GAM354 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM569 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM569 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM569 target RNA into GAM569 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM821 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM821 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM821 target RNA into GAM821 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM2911 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM2911 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2911 target RNA into GAM2911 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3

TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7645 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7645 polynucleotide: GAM354 target protein, GAM569 target protein, GAM821 target protein and GAM2911 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM354, GAM569, GAM821 and GAM2911

GR7646 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7646(GR7646) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7646 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7646 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7646 precursor DNA encodes GR7646 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7646 is located from position 54100819 to position 54100905 relative to chromosome chr19 on the `+` strand (chr is an abbreviation for chromosome).

GR7646 precursor RNA folds spatially, forming GR7646 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7646 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7646 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7646 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM5512 precursor RNA and GAM5691 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM5512 RNA and GAM5691 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM5512 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM5512 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM5512 target RNA into GAM5512 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM5691 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM5691 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM5691 target RNA into GAM5691 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7646 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7646 polynucleotide: GAM5512 target protein and GAM5691 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM5512 and GAM5691

GR7647 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7647(GR7647) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7647 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7647 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7647 precursor DNA encodes GR7647 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7647 is located from position 57778075 to position 57778156 relative to chromosome chr19 on the `+` strand (chr is an abbreviation for chromosome).

GR7647 precursor RNA folds spatially, forming GR7647 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7647 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7647 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at

least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7647 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336929 precursor RNA and GAM336930 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336929 RNA and GAM336930 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336929 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336929 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336929 target RNA into GAM336929 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336930 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336930 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336930 target RNA into GAM336930 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7647 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7647 polynucleotide: GAM336929 target protein and GAM336930 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336929 and GAM336930

GR7648 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7648(GR7648) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7648 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The

method by which GR7648 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7648 precursor DNA encodes GR7648 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7648 is located from position 23264637 to position 23265347 relative to chromosome chr19 on the `-` strand (chr is an abbreviation for chromosome).

GR7648 precursor RNA folds spatially, forming GR7648 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7648 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7648 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7648 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336520 precursor RNA and GAM336521 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336520 RNA and GAM336521 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336520 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336520 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336520 target RNA into GAM336520 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336521 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336521 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336521 target RNA into GAM336521 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7648 polynucleotide correlate with, and may be deduced from, the identity of

the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7648 polynucleotide: GAM336520 target protein and GAM336521 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336520 and GAM336521

GR7649 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7649(GR7649) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7649 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7649 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7649 precursor DNA encodes GR7649 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7649 is located from position 41616369 to position 41616499 relative to chromosome chr19 on the `-` strand (chr is an abbreviation for chromosome).

GR7649 precursor RNA folds spatially, forming GR7649 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7649 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7649 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7649 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336744 precursor RNA and GAM336745 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336744 RNA and GAM336745 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336744 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336744 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to

a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336744 target RNA into GAM336744 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336745 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336745 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336745 target RNA into GAM336745 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7649 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7649 polynucleotide: GAM336744 target protein and GAM336745 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336744 and GAM336745

GR7650 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7650(GR7650) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7650 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7650 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7650 precursor DNA encodes GR7650 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7650 is located from position 108732269 to position 108732372 relative to chromosome chr2 on the `+` strand (chr is an abbreviation for chromosome).

GR7650 precursor RNA folds spatially, forming GR7650 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7650 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7650 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7650 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 4 separate

GAM precursor RNAs, GAM337399 precursor RNA, GAM337400 precursor RNA, GAM337401 precursor RNA and GAM337402 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337399 RNA, GAM337400 RNA, GAM337401 RNA and GAM337402 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337399 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337399 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337399 target RNA into GAM337399 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337400 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337400 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337400 target RNA into GAM337400 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337401 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337401 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337401 target RNA into GAM337401 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337402 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337402 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337402 target RNA into GAM337402 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7650 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7650 polynucleotide: GAM337399 target protein, GAM337400 target protein, GAM337401 target protein and GAM337402 target protein, herein

schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337399, GAM337400, GAM337401 and GAM337402

GR7651 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7651(GR7651) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7651 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7651 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7651 precursor DNA encodes GR7651 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7651 is located from position 131845700 to position 131845801 relative to chromosome chr2 on the `+` strand (chr is an abbreviation for chromosome).

GR7651 precursor RNA folds spatially, forming GR7651 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7651 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7651 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7651 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337548 precursor RNA and GAM337549 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337548 RNA and GAM337549 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337548 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337548 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337548 target RNA into GAM337548

target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337549 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337549 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337549 target RNA into GAM337549 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7651 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7651 polynucleotide: GAM337548 target protein and GAM337549 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337548 and GAM337549

GR7652 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7652(GR7652) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7652 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7652 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7652 precursor DNA encodes GR7652 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7652 is located from position 20036295 to position 20036386 relative to chromosome chr20 on the `+` strand (chr is an abbreviation for chromosome).

GR7652 precursor RNA folds spatially, forming GR7652 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7652 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7652 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7652 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336469 precursor RNA and GAM336470 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED

PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336469 RNA and GAM336470 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336469 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336469 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336469 target RNA into GAM336469 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336470 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336470 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336470 target RNA into GAM336470 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7652 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7652 polynucleotide: GAM336469 target protein and GAM336470 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336469 and GAM336470

GR7653 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7653(GR7653) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7653 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7653 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7653 precursor DNA encodes GR7653 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7653 is located from position 31005522 to position 31005621 relative to chromosome chr20 on the `+` strand (chr is an

abbreviation for chromosome).

GR7653 precursor RNA folds spatially, forming GR7653 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7653 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7653 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7653 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336603 precursor RNA and GAM336604 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336603 RNA and GAM336604 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336603 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336603 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336603 target RNA into GAM336603 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336604 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336604 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336604 target RNA into GAM336604 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7653 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7653 polynucleotide: GAM336603 target protein and GAM336604 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336603 and GAM336604

GR7654 Fig. 16 further provides a conceptual description of novel bioinformatically

detected regulatory polynucleotide, referred to here as Genomic Record 7654(GR7654) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7654 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7654 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7654 precursor DNA encodes GR7654 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7654 is located from position 42908008 to position 42908095 relative to chromosome chr20 on the `+` strand (chr is an abbreviation for chromosome).

GR7654 precursor RNA folds spatially, forming GR7654 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7654 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7654 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7654 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336764 precursor RNA and GAM336765 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336764 RNA and GAM336765 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336764 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336764 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336764 target RNA into GAM336764 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336765 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336765 target RNA, herein schematically represented by

GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336765 target RNA into GAM336765 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7654 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7654 polynucleotide: GAM336764 target protein and GAM336765 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336764 and GAM336765

GR7655 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7655(GR7655) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7655 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7655 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7655 precursor DNA encodes GR7655 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7655 is located from position 49549736 to position 49549822 relative to chromosome chr20 on the `+` strand (chr is an abbreviation for chromosome).

GR7655 precursor RNA folds spatially, forming GR7655 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7655 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7655 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7655 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336861 precursor RNA and GAM336862 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides

in length, GAM336861 RNA and GAM336862 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336861 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336861 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336861 target RNA into GAM336861 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336862 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336862 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336862 target RNA into GAM336862 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7655 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7655 polynucleotide: GAM336861 target protein and GAM336862 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336861 and GAM336862

GR7656 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7656(GR7656) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7656 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7656 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7656 precursor DNA encodes GR7656 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7656 is located from position 63567534 to position 63572564 relative to chromosome chr20 on the `+` strand (chr is an abbreviation for chromosome).

GR7656 precursor RNA folds spatially, forming GR7656 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7656 folded precursor RNA comprises a plurality of what is known in the art as

`hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7656 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7656 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336997 precursor RNA and GAM336998 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336997 RNA and GAM336998 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336997 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336997 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336997 target RNA into GAM336997 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336998 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336998 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336998 target RNA into GAM336998 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7656 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7656 polynucleotide: GAM336997 target protein and GAM336998 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336997 and GAM336998

GR7657 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7657(GR7657) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7657 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7657 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7657 precursor DNA encodes GR7657 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7657 is located from position 12348835 to position 12348934 relative to chromosome chr20 on the `-` strand (chr is an abbreviation for chromosome).

GR7657 precursor RNA folds spatially, forming GR7657 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7657 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7657 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7657 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336384 precursor RNA and GAM336385 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336384 RNA and GAM336385 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336384 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336384 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336384 target RNA into GAM336384 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336385 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336385 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336385 target RNA into GAM336385 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7657 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7657 polynucleotide: GAM336384 target protein and GAM336385 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336384 and GAM336385

GR7658 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7658(GR7658) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7658 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7658 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7658 precursor DNA encodes GR7658 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7658 is located from position 32615342 to position 32615450 relative to chromosome chr21 on the `+` strand (chr is an abbreviation for chromosome).

GR7658 precursor RNA folds spatially, forming GR7658 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7658 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7658 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7658 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM336618 precursor RNA, GAM336619 precursor RNA and GAM336620 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336618 RNA, GAM336619 RNA and GAM336620 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336618 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336618 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336618 target RNA into GAM336618 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336619 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336619 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336619 target RNA into GAM336619 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336620 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336620 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336620 target RNA into GAM336620 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7658 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7658 polynucleotide: GAM336618 target protein, GAM336619 target protein and GAM336620 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336618, GAM336619 and GAM336620

GR7659 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7659(GR7659) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7659 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7659 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7659 precursor DNA encodes GR7659 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7659 is located from position 33064923 to position 33065013 relative to chromosome chr21 on the `+` strand (chr is an

abbreviation for chromosome).

GR7659 precursor RNA folds spatially, forming GR7659 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7659 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7659 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7659 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336624 precursor RNA and GAM336625 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336624 RNA and GAM336625 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336624 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336624 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336624 target RNA into GAM336624 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336625 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336625 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336625 target RNA into GAM336625 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7659 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7659 polynucleotide: GAM336624 target protein and GAM336625 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336624 and GAM336625

GR7660 Fig. 16 further provides a conceptual description of novel bioinformatically

detected regulatory polynucleotide, referred to here as Genomic Record 7660(GR7660) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7660 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7660 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7660 precursor DNA encodes GR7660 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7660 is located from position 42749659 to position 42749770 relative to chromosome chr21 on the `+` strand (chr is an abbreviation for chromosome).

GR7660 precursor RNA folds spatially, forming GR7660 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7660 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7660 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7660 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336758 precursor RNA and GAM336759 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336758 RNA and GAM336759 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336758 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336758 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336758 target RNA into GAM336758 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336759 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336759 target RNA, herein schematically represented by

GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336759 target RNA into GAM336759 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7660 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7660 polynucleotide: GAM336758 target protein and GAM336759 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336758 and GAM336759

GR7661 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7661(GR7661) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7661 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7661 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7661 precursor DNA encodes GR7661 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7661 is located from position 44376402 to position 44376497 relative to chromosome chr21 on the `+` strand (chr is an abbreviation for chromosome).

GR7661 precursor RNA folds spatially, forming GR7661 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7661 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7661 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7661 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336781 precursor RNA and GAM336782 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides

in length, GAM336781 RNA and GAM336782 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336781 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336781 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336781 target RNA into GAM336781 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336782 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336782 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336782 target RNA into GAM336782 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7661 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7661 polynucleotide: GAM336781 target protein and GAM336782 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336781 and GAM336782

GR7662 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7662(GR7662) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7662 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7662 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7662 precursor DNA encodes GR7662 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7662 is located from position 17740558 to position 17740658 relative to chromosome chr22 on the `+` strand (chr is an abbreviation for chromosome).

GR7662 precursor RNA folds spatially, forming GR7662 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7662 folded precursor RNA comprises a plurality of what is known in the art as

`hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7662 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7662 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336436 precursor RNA and GAM336437 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336436 RNA and GAM336437 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336436 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336436 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336436 target RNA into GAM336436 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336437 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336437 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336437 target RNA into GAM336437 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7662 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7662 polynucleotide: GAM336436 target protein and GAM336437 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336436 and GAM336437

GR7663 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7663(GR7663) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7663 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7663 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7663 precursor DNA encodes GR7663 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7663 is located from position 24199772 to position 24199866 relative to chromosome chr22 on the `+` strand (chr is an abbreviation for chromosome).

GR7663 precursor RNA folds spatially, forming GR7663 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7663 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7663 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7663 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336528 precursor RNA and GAM336529 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336528 RNA and GAM336529 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336528 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336528 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336528 target RNA into GAM336528 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336529 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336529 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336529 target RNA into GAM336529 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7663 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7663 polynucleotide: GAM336528 target protein and GAM336529 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336528 and GAM336529

GR7664 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7664(GR7664) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7664 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7664 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7664 precursor DNA encodes GR7664 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7664 is located from position 49370569 to position 49370681 relative to chromosome chr22 on the `+` strand (chr is an abbreviation for chromosome).

GR7664 precursor RNA folds spatially, forming GR7664 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7664 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7664 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7664 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336858 precursor RNA and GAM336859 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336858 RNA and GAM336859 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336858 RNA, herein schematically represented by GAM1 RNA through

GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336858 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336858 target RNA into GAM336858 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336859 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336859 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336859 target RNA into GAM336859 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7664 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7664 polynucleotide: GAM336858 target protein and GAM336859 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336858 and GAM336859

GR7665 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7665(GR7665) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7665 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7665 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7665 precursor DNA encodes GR7665 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7665 is located from position 9793682 to position 9793766 relative to chromosome chr3 on the `+` strand (chr is an abbreviation for chromosome).

GR7665 precursor RNA folds spatially, forming GR7665 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7665 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7665 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7665 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM336341 precursor RNA, GAM336342 precursor RNA and GAM336343 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336341 RNA, GAM336342 RNA and GAM336343 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336341 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336341 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336341 target RNA into GAM336341 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336342 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336342 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336342 target RNA into GAM336342 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336343 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336343 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336343 target RNA into GAM336343 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7665 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7665 polynucleotide: GAM336341 target protein, GAM336342 target protein and GAM336343 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336341, GAM336342 and GAM336343

 Fig. 16 further provides a conceptual description of novel bioinformatically

detected regulatory polynucleotide, referred to here as Genomic Record 7666(GR7666) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7666 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7666 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7666 precursor DNA encodes GR7666 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7666 is located from position 40002861 to position 40002950 relative to chromosome chr4 on the `+` strand (chr is an abbreviation for chromosome).

GR7666 precursor RNA folds spatially, forming GR7666 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7666 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7666 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7666 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336716 precursor RNA and GAM336717 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336716 RNA and GAM336717 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336716 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336716 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336716 target RNA into GAM336716 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336717 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336717 target RNA, herein schematically represented by

GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336717 target RNA into GAM336717 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7666 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7666 polynucleotide: GAM336716 target protein and GAM336717 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336716 and GAM336717

GR7667 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7667(GR7667) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7667 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7667 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7667 precursor DNA encodes GR7667 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7667 is located from position 95449990 to position 95450088 relative to chromosome chr4 on the `+` strand (chr is an abbreviation for chromosome).

GR7667 precursor RNA folds spatially, forming GR7667 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7667 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7667 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7667 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM189 precursor RNA and GAM3190 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides

in length, GAM189 RNA and GAM3190 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM189 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM189 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM189 target RNA into GAM189 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM3190 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM3190 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM3190 target RNA into GAM3190 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7667 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7667 polynucleotide: GAM189 target protein and GAM3190 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM189 and GAM3190

GR7668 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7668(GR7668) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7668 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7668 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7668 precursor DNA encodes GR7668 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7668 is located from position 7755711 to position 7755813 relative to chromosome chr5 on the `+` strand (chr is an abbreviation for chromosome).

GR7668 precursor RNA folds spatially, forming GR7668 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7668 folded precursor RNA comprises a plurality of what is known in the art as

`hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7668 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7668 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM336315 precursor RNA, GAM336316 precursor RNA and GAM336317 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336315 RNA, GAM336316 RNA and GAM336317 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336315 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336315 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336315 target RNA into GAM336315 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336316 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336316 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336316 target RNA into GAM336316 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336317 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336317 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336317 target RNA into GAM336317 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7668 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7668 polynucleotide: GAM336315 target protein, GAM336316 target protein and GAM336317 target protein, herein schematically represented by GAM1

TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336315, GAM336316 and GAM336317

GR7669 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7669(GR7669) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7669 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7669 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7669 precursor DNA encodes GR7669 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7669 is located from position 69818313 to position 69818412 relative to chromosome chr5 on the `+` strand (chr is an abbreviation for chromosome).

GR7669 precursor RNA folds spatially, forming GR7669 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7669 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7669 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7669 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337069 precursor RNA and GAM337070 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337069 RNA and GAM337070 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337069 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337069 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337069 target RNA into GAM337069

target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337070 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337070 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337070 target RNA into GAM337070 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7669 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7669 polynucleotide: GAM337069 target protein and GAM337070 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337069 and GAM337070

GR7670 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7670(GR7670) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7670 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7670 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7670 precursor DNA encodes GR7670 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7670 is located from position 70361144 to position 70361243 relative to chromosome chr5 on the `+` strand (chr is an abbreviation for chromosome).

GR7670 precursor RNA folds spatially, forming GR7670 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7670 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7670 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7670 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337081 precursor RNA and GAM337082 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED

PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337081 RNA and GAM337082 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337081 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337081 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337081 target RNA into GAM337081 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337082 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337082 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337082 target RNA into GAM337082 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7670 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7670 polynucleotide: GAM337081 target protein and GAM337082 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337081 and GAM337082

GR7671 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7671(GR7671) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7671 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7671 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7671 precursor DNA encodes GR7671 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7671 is located from position 69076604 to position 69076703 relative to chromosome chr5 on the `-` strand (chr is an

abbreviation for chromosome).

GR7671 precursor RNA folds spatially, forming GR7671 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7671 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7671 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7671 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM689 precursor RNA and GAM337060 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM689 RNA and GAM337060 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM689 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM689 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM689 target RNA into GAM689 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337060 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337060 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337060 target RNA into GAM337060 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7671 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7671 polynucleotide: GAM689 target protein and GAM337060 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM689 and GAM337060

GR7672 Fig. 16 further provides a conceptual description of novel bioinformatically

detected regulatory polynucleotide, referred to here as Genomic Record 7672(GR7672) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7672 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7672 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7672 precursor DNA encodes GR7672 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7672 is located from position 30850314 to position 30850405 relative to chromosome chr6 on the `+` strand (chr is an abbreviation for chromosome).

GR7672 precursor RNA folds spatially, forming GR7672 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7672 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7672 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7672 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM5990 precursor RNA and GAM6459 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM5990 RNA and GAM6459 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM5990 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM5990 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM5990 target RNA into GAM5990 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM6459 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM6459 target RNA, herein schematically represented by GAM1 TARGET RNA

through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM6459 target RNA into GAM6459 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7672 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7672 polynucleotide: GAM5990 target protein and GAM6459 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM5990 and GAM6459

GR7673 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7673(GR7673) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7673 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7673 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7673 precursor DNA encodes GR7673 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7673 is located from position 31554609 to position 31554710 relative to chromosome chr6 on the `+` strand (chr is an abbreviation for chromosome).

GR7673 precursor RNA folds spatially, forming GR7673 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7673 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7673 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7673 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336607 precursor RNA and GAM336608 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides

in length, GAM336607 RNA and GAM336608 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336607 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336607 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336607 target RNA into GAM336607 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336608 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336608 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336608 target RNA into GAM336608 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7673 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7673 polynucleotide: GAM336607 target protein and GAM336608 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336607 and GAM336608

GR7674 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7674(GR7674) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7674 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7674 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7674 precursor DNA encodes GR7674 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7674 is located from position 17062054 to position 17062168 relative to chromosome chr7 on the `+` strand (chr is an abbreviation for chromosome).

GR7674 precursor RNA folds spatially, forming GR7674 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7674 folded precursor RNA comprises a plurality of what is known in the art as

`hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7674 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7674 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336430 precursor RNA and GAM336431 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336430 RNA and GAM336431 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336430 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336430 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336430 target RNA into GAM336430 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336431 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336431 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336431 target RNA into GAM336431 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7674 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7674 polynucleotide: GAM336430 target protein and GAM336431 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336430 and GAM336431

GR7675 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7675(GR7675) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7675 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7675 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7675 precursor DNA encodes GR7675 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7675 is located from position 29435833 to position 29435938 relative to chromosome chr7 on the `+` strand (chr is an abbreviation for chromosome).

GR7675 precursor RNA folds spatially, forming GR7675 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7675 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7675 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7675 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336587 precursor RNA and GAM336588 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336587 RNA and GAM336588 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336587 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336587 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336587 target RNA into GAM336587 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336588 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336588 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336588 target RNA into GAM336588 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7675 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7675 polynucleotide: GAM336587 target protein and GAM336588 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336587 and GAM336588

GR7676 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7676(GR7676) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7676 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7676 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7676 precursor DNA encodes GR7676 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7676 is located from position 36291960 to position 36292084 relative to chromosome chr7 on the `+` strand (chr is an abbreviation for chromosome).

GR7676 precursor RNA folds spatially, forming GR7676 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7676 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7676 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7676 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336667 precursor RNA and GAM336668 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336667 RNA and GAM336668 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336667 RNA, herein schematically represented by GAM1 RNA through

GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336667 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336667 target RNA into GAM336667 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336668 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336668 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336668 target RNA into GAM336668 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7676 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7676 polynucleotide: GAM336667 target protein and GAM336668 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336667 and GAM336668

GR7677 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7677(GR7677) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7677 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7677 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7677 precursor DNA encodes GR7677 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7677 is located from position 55877656 to position 55877772 relative to chromosome chr7 on the `+` strand (chr is an abbreviation for chromosome).

GR7677 precursor RNA folds spatially, forming GR7677 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7677 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7677 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7677 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM3001 precursor RNA and GAM3160 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM3001 RNA and GAM3160 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM3001 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM3001 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM3001 target RNA into GAM3001 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM3160 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM3160 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM3160 target RNA into GAM3160 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7677 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7677 polynucleotide: GAM3001 target protein and GAM3160 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM3001 and GAM3160

GR7678 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7678(GR7678) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7678 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7678 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7678 precursor DNA encodes GR7678 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7678 is located from position 65815377 to position 65815469 relative to chromosome chr7 on the `+` strand (chr is an abbreviation for chromosome).

GR7678 precursor RNA folds spatially, forming GR7678 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7678 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7678 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7678 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337023 precursor RNA and GAM337024 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337023 RNA and GAM337024 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337023 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337023 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337023 target RNA into GAM337023 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337024 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337024 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337024 target RNA into GAM337024 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7678 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7678 polynucleotide: GAM337023 target protein and GAM337024 target

protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337023 and GAM337024

GR7679 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7679(GR7679) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7679 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7679 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7679 precursor DNA encodes GR7679 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7679 is located from position 72274763 to position 72274861 relative to chromosome chr7 on the `+` strand (chr is an abbreviation for chromosome).

GR7679 precursor RNA folds spatially, forming GR7679 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7679 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7679 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7679 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM337111 precursor RNA, GAM337112 precursor RNA and GAM337113 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337111 RNA, GAM337112 RNA and GAM337113 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337111 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337111 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III

of Fig. 8, thereby inhibiting translation of GAM337111 target RNA into GAM337111 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337112 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337112 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337112 target RNA into GAM337112 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337113 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337113 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337113 target RNA into GAM337113 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7679 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7679 polynucleotide: GAM337111 target protein, GAM337112 target protein and GAM337113 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337111, GAM337112 and GAM337113

GR7680 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7680(GR7680) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7680 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7680 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7680 precursor DNA encodes GR7680 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7680 is located from position 73215042 to position 73215142 relative to chromosome chr7 on the `+` strand (chr is an abbreviation for chromosome).

GR7680 precursor RNA folds spatially, forming GR7680 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7680 folded precursor RNA comprises a plurality of what is known in the art as

`hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7680 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7680 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337127 precursor RNA and GAM337128 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337127 RNA and GAM337128 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337127 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337127 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337127 target RNA into GAM337127 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337128 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337128 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337128 target RNA into GAM337128 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7680 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7680 polynucleotide: GAM337127 target protein and GAM337128 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337127 and GAM337128

GR7681 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7681(GR7681) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7681 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7681 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7681 precursor DNA encodes GR7681 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7681 is located from position 78652714 to position 78652815 relative to chromosome chr7 on the `+` strand (chr is an abbreviation for chromosome).

GR7681 precursor RNA folds spatially, forming GR7681 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7681 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7681 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7681 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337188 precursor RNA and GAM337189 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337188 RNA and GAM337189 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337188 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337188 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337188 target RNA into GAM337188 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337189 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337189 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337189 target RNA into GAM337189 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7681 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7681 polynucleotide: GAM337188 target protein and GAM337189 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337188 and GAM337189

GR7682 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7682(GR7682) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7682 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7682 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7682 precursor DNA encodes GR7682 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7682 is located from position 84223987 to position 84224087 relative to chromosome chr7 on the `+` strand (chr is an abbreviation for chromosome).

GR7682 precursor RNA folds spatially, forming GR7682 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7682 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7682 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7682 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337207 precursor RNA and GAM337208 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337207 RNA and GAM337208 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337207 RNA, herein schematically represented by GAM1 RNA through

GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337207 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337207 target RNA into GAM337207 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337208 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337208 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337208 target RNA into GAM337208 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7682 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7682 polynucleotide: GAM337207 target protein and GAM337208 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337207 and GAM337208

GR7683 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7683(GR7683) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7683 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7683 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7683 precursor DNA encodes GR7683 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7683 is located from position 98227794 to position 98227886 relative to chromosome chr7 on the `+` strand (chr is an abbreviation for chromosome).

GR7683 precursor RNA folds spatially, forming GR7683 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7683 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7683 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7683 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337299 precursor RNA and GAM337300 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337299 RNA and GAM337300 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337299 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337299 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337299 target RNA into GAM337299 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337300 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337300 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337300 target RNA into GAM337300 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7683 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7683 polynucleotide: GAM337299 target protein and GAM337300 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337299 and GAM337300

GR7684 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7684(GR7684) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7684 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7684 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7684 precursor DNA encodes GR7684 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7684 is located from position 104082522 to position 104082645 relative to chromosome chr7 on the `+` strand (chr is an abbreviation for chromosome).

GR7684 precursor RNA folds spatially, forming GR7684 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7684 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7684 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7684 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM6440 precursor RNA and GAM7095 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM6440 RNA and GAM7095 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM6440 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM6440 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM6440 target RNA into GAM6440 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM7095 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM7095 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM7095 target RNA into GAM7095 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7684 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7684 polynucleotide: GAM6440 target protein and GAM7095 target

protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM6440 and GAM7095

GR7685 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7685(GR7685) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7685 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7685 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7685 precursor DNA encodes GR7685 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7685 is located from position 113861407 to position 113861497 relative to chromosome chr7 on the `+` strand (chr is an abbreviation for chromosome).

GR7685 precursor RNA folds spatially, forming GR7685 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7685 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7685 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7685 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM337446 precursor RNA, GAM337447 precursor RNA and GAM337448 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337446 RNA, GAM337447 RNA and GAM337448 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337446 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337446 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III

of Fig. 8, thereby inhibiting translation of GAM337446 target RNA into GAM337446 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337447 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337447 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337447 target RNA into GAM337447 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337448 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337448 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337448 target RNA into GAM337448 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7685 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7685 polynucleotide: GAM337446 target protein, GAM337447 target protein and GAM337448 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337446, GAM337447 and GAM337448

GR7686 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7686(GR7686) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7686 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7686 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7686 precursor DNA encodes GR7686 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7686 is located from position 133099401 to position 133099515 relative to chromosome chr7 on the `+` strand (chr is an abbreviation for chromosome).

GR7686 precursor RNA folds spatially, forming GR7686 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7686 folded precursor RNA comprises a plurality of what is known in the art as

`hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7686 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7686 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM1942 precursor RNA, GAM5329 precursor RNA and GAM6271 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1942 RNA, GAM5329 RNA and GAM6271 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM1942 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM1942 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1942 target RNA into GAM1942 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM5329 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM5329 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM5329 target RNA into GAM5329 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM6271 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM6271 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM6271 target RNA into GAM6271 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7686 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7686 polynucleotide: GAM1942 target protein, GAM5329 target protein and GAM6271 target protein, herein schematically represented by GAM1 TARGET

PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM1942, GAM5329 and GAM6271

GR7687 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7687(GR7687) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7687 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7687 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7687 precursor DNA encodes GR7687 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7687 is located from position 151157892 to position 151157998 relative to chromosome chr7 on the `+` strand (chr is an abbreviation for chromosome).

GR7687 precursor RNA folds spatially, forming GR7687 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7687 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7687 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7687 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337609 precursor RNA and GAM337610 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337609 RNA and GAM337610 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337609 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337609 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337609 target RNA into GAM337609 target protein, herein schematically represented by GAM1 TARGET PROTEIN through

GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337610 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337610 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337610 target RNA into GAM337610 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7687 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7687 polynucleotide: GAM337609 target protein and GAM337610 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337609 and GAM337610

GR7688 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7688(GR7688) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7688 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7688 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7688 precursor DNA encodes GR7688 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7688 is located from position 55787167 to position 55787245 relative to chromosome chr7 on the `-` strand (chr is an abbreviation for chromosome).

GR7688 precursor RNA folds spatially, forming GR7688 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7688 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7688 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7688 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336904 precursor RNA and GAM336905 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA

segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336904 RNA and GAM336905 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336904 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336904 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336904 target RNA into GAM336904 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336905 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336905 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336905 target RNA into GAM336905 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7688 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7688 polynucleotide: GAM336904 target protein and GAM336905 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336904 and GAM336905

GR7689 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7689(GR7689) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7689 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7689 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7689 precursor DNA encodes GR7689 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7689 is located from position 66122717 to position 66122818 relative to chromosome chr7 on the `-` strand (chr is an abbreviation for chromosome).

GR7689 precursor RNA folds spatially, forming GR7689 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7689 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7689 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7689 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337027 precursor RNA and GAM337028 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337027 RNA and GAM337028 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337027 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337027 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337027 target RNA into GAM337027 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337028 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337028 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337028 target RNA into GAM337028 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7689 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7689 polynucleotide: GAM337027 target protein and GAM337028 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337027 and GAM337028

GR7690 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record

7690(GR7690) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7690 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7690 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7690 precursor DNA encodes GR7690 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7690 is located from position 12908963 to position 12909066 relative to chromosome chr8 on the `+` strand (chr is an abbreviation for chromosome).

GR7690 precursor RNA folds spatially, forming GR7690 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7690 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7690 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7690 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336394 precursor RNA and GAM336395 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336394 RNA and GAM336395 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336394 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336394 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336394 target RNA into GAM336394 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336395 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336395 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to

a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336395 target RNA into GAM336395 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7690 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7690 polynucleotide: GAM336394 target protein and GAM336395 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336394 and GAM336395

GR7691 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7691(GR7691) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7691 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7691 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7691 precursor DNA encodes GR7691 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7691 is located from position 21935927 to position 21936034 relative to chromosome chr8 on the `+` strand (chr is an abbreviation for chromosome).

GR7691 precursor RNA folds spatially, forming GR7691 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7691 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7691 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7691 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336497 precursor RNA and GAM336498 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336497 RNA and GAM336498 RNA, herein schematically represented by

GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336497 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336497 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336497 target RNA into GAM336497 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336498 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336498 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336498 target RNA into GAM336498 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7691 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7691 polynucleotide: GAM336497 target protein and GAM336498 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336497 and GAM336498

GR7692 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7692(GR7692) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7692 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7692 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7692 precursor DNA encodes GR7692 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7692 is located from position 41616885 to position 41616976 relative to chromosome chr8 on the `+` strand (chr is an abbreviation for chromosome).

GR7692 precursor RNA folds spatially, forming GR7692 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7692 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the

nucleotide sequence of GR7692 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7692 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336746 precursor RNA and GAM336747 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336746 RNA and GAM336747 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336746 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336746 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336746 target RNA into GAM336746 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336747 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336747 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336747 target RNA into GAM336747 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7692 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7692 polynucleotide: GAM336746 target protein and GAM336747 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336746 and GAM336747

GR7693 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7693(GR7693) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7693 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7693 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7693 precursor DNA encodes GR7693 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7693 is located from position 54026269 to position 54026340 relative to chromosome chr8 on the `+` strand (chr is an abbreviation for chromosome).

GR7693 precursor RNA folds spatially, forming GR7693 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7693 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7693 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7693 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2171 precursor RNA and GAM6531 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2171 RNA and GAM6531 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM2171 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM2171 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2171 target RNA into GAM2171 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM6531 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM6531 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM6531 target RNA into GAM6531 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7693 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7693 polynucleotide: GAM2171 target protein and GAM6531 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM2171 and GAM6531

GR7694 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7694(GR7694) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7694 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7694 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7694 precursor DNA encodes GR7694 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7694 is located from position 101882283 to position 101882352 relative to chromosome chr8 on the `+` strand (chr is an abbreviation for chromosome).

GR7694 precursor RNA folds spatially, forming GR7694 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7694 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7694 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7694 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM5082 precursor RNA and GAM7700 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM5082 RNA and GAM7700 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM5082 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated

region of GAM5082 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM5082 target RNA into GAM5082 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM7700 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM7700 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM7700 target RNA into GAM7700 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7694 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7694 polynucleotide: GAM5082 target protein and GAM7700 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM5082 and GAM7700

GR7695 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7695(GR7695) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7695 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7695 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7695 precursor DNA encodes GR7695 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7695 is located from position 141572888 to position 141572989 relative to chromosome chr8 on the `+` strand (chr is an abbreviation for chromosome).

GR7695 precursor RNA folds spatially, forming GR7695 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7695 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7695 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7695 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337586 precursor RNA and GAM337587 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337586 RNA and GAM337587 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337586 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337586 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337586 target RNA into GAM337586 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337587 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337587 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337587 target RNA into GAM337587 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7695 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7695 polynucleotide: GAM337586 target protein and GAM337587 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337586 and GAM337587

GR7696 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7696(GR7696) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7696 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7696 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7696 precursor DNA encodes GR7696 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7696 is located from position 10822733 to position 10822834 relative to chromosome chr8 on the `-` strand (chr is an abbreviation for chromosome).

GR7696 precursor RNA folds spatially, forming GR7696 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7696 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7696 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7696 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336359 precursor RNA and GAM336360 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336359 RNA and GAM336360 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336359 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336359 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336359 target RNA into GAM336359 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336360 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336360 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336360 target RNA into GAM336360 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7696 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7696 polynucleotide: GAM336359 target protein and GAM336360 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3

TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336359 and GAM336360

GR7697 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7697(GR7697) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7697 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7697 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7697 precursor DNA encodes GR7697 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7697 is located from position 53863297 to position 53863389 relative to chromosome chr8 on the `-` strand (chr is an abbreviation for chromosome).

GR7697 precursor RNA folds spatially, forming GR7697 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7697 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7697 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7697 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336894 precursor RNA and GAM336895 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336894 RNA and GAM336895 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336894 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336894 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336894 target RNA into GAM336894 target protein, herein schematically represented by GAM1 TARGET PROTEIN through

GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336895 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336895 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336895 target RNA into GAM336895 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7697 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7697 polynucleotide: GAM336894 target protein and GAM336895 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336894 and GAM336895

GR7698 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7698(GR7698) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7698 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7698 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7698 precursor DNA encodes GR7698 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7698 is located from position 106717983 to position 106718084 relative to chromosome chr8 on the `-` strand (chr is an abbreviation for chromosome).

GR7698 precursor RNA folds spatially, forming GR7698 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7698 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7698 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7698 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337388 precursor RNA and GAM337389 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA

segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337388 RNA and GAM337389 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337388 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337388 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337388 target RNA into GAM337388 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337389 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337389 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337389 target RNA into GAM337389 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7698 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7698 polynucleotide: GAM337388 target protein and GAM337389 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337388 and GAM337389

GR7699 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7699(GR7699) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7699 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7699 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7699 precursor DNA encodes GR7699 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7699 is located from position 132744616 to position 132744727 relative to chromosome chr8 on the `-` strand (chr is an abbreviation for chromosome).

GR7699 precursor RNA folds spatially, forming GR7699 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7699 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7699 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7699 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337553 precursor RNA and GAM337554 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337553 RNA and GAM337554 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337553 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337553 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337553 target RNA into GAM337553 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337554 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337554 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337554 target RNA into GAM337554 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7699 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7699 polynucleotide: GAM337553 target protein and GAM337554 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337553 and GAM337554

GR7700 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record

7700(GR7700) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7700 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7700 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7700 precursor DNA encodes GR7700 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7700 is located from position 135501500 to position 135501600 relative to chromosome chr8 on the `-` strand (chr is an abbreviation for chromosome).

GR7700 precursor RNA folds spatially, forming GR7700 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7700 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7700 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7700 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM337567 precursor RNA, GAM337568 precursor RNA and GAM337569 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337567 RNA, GAM337568 RNA and GAM337569 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337567 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337567 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337567 target RNA into GAM337567 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337568 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337568 target RNA, herein schematically represented by

GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337568 target RNA into GAM337568 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337569 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337569 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337569 target RNA into GAM337569 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7700 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7700 polynucleotide: GAM337567 target protein, GAM337568 target protein and GAM337569 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337567, GAM337568 and GAM337569

GR7701 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7701(GR7701) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7701 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7701 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7701 precursor DNA encodes GR7701 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7701 is located from position 141088822 to position 141088915 relative to chromosome chr8 on the `-` strand (chr is an abbreviation for chromosome).

GR7701 precursor RNA folds spatially, forming GR7701 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7701 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7701 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7701 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337584 precursor RNA and GAM337585 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337584 RNA and GAM337585 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337584 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337584 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337584 target RNA into GAM337584 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337585 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337585 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337585 target RNA into GAM337585 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7701 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7701 polynucleotide: GAM337584 target protein and GAM337585 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337584 and GAM337585

GR7702 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7702(GR7702) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7702 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7702 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7702 precursor DNA encodes GR7702 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7702 is located from position 6225060 to position 6225156 relative to chromosome chr9 on the `+` strand (chr is an abbreviation for chromosome).

GR7702 precursor RNA folds spatially, forming GR7702 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7702 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7702 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7702 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336299 precursor RNA and GAM336300 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336299 RNA and GAM336300 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336299 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336299 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336299 target RNA into GAM336299 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336300 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336300 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336300 target RNA into GAM336300 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7702 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7702 polynucleotide: GAM336299 target protein and GAM336300 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3

TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336299 and GAM336300

GR7703 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7703(GR7703) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7703 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7703 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7703 precursor DNA encodes GR7703 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7703 is located from position 37420113 to position 37422669 relative to chromosome chr9 on the `+` strand (chr is an abbreviation for chromosome).

GR7703 precursor RNA folds spatially, forming GR7703 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7703 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7703 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7703 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM329 precursor RNA and GAM336681 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM329 RNA and GAM336681 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM329 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM329 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM329 target RNA into GAM329 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3

TARGET PROTEIN, both of Fig. 8.

GAM336681 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336681 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336681 target RNA into GAM336681 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7703 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7703 polynucleotide: GAM329 target protein and GAM336681 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM329 and GAM336681

GR7704 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7704(GR7704) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7704 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7704 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7704 precursor DNA encodes GR7704 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7704 is located from position 66974964 to position 66975069 relative to chromosome chr9 on the `+` strand (chr is an abbreviation for chromosome).

GR7704 precursor RNA folds spatially, forming GR7704 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7704 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7704 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7704 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM337037 precursor RNA, GAM337038 precursor RNA and GAM337039 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs

being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337037 RNA, GAM337038 RNA and GAM337039 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337037 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337037 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337037 target RNA into GAM337037 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337038 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337038 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337038 target RNA into GAM337038 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337039 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337039 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337039 target RNA into GAM337039 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7704 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7704 polynucleotide: GAM337037 target protein, GAM337038 target protein and GAM337039 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337037, GAM337038 and GAM337039

GR7705 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7705(GR7705) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7705 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7705 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7705 precursor DNA encodes GR7705 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7705 is located from position 78004551 to position 78004659 relative to chromosome chr9 on the `+` strand (chr is an abbreviation for chromosome).

GR7705 precursor RNA folds spatially, forming GR7705 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7705 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7705 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7705 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM2306 precursor RNA and GAM6265 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM2306 RNA and GAM6265 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM2306 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM2306 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM2306 target RNA into GAM2306 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM6265 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM6265 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM6265 target RNA into GAM6265 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7705 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7705 polynucleotide: GAM2306 target protein and GAM6265 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM2306 and GAM6265

GR7706 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7706(GR7706) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7706 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7706 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7706 precursor DNA encodes GR7706 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7706 is located from position 88520248 to position 88520363 relative to chromosome chr9 on the `+` strand (chr is an abbreviation for chromosome).

GR7706 precursor RNA folds spatially, forming GR7706 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7706 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7706 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7706 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 4 separate GAM precursor RNAs, GAM1217 precursor RNA, GAM3461 precursor RNA, GAM4557 precursor RNA and GAM7636 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM1217 RNA, GAM3461 RNA, GAM4557 RNA and GAM7636 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM1217 RNA, herein schematically represented by GAM1 RNA through GAM3

RNA, binds complementarily to a target binding site located in an untranslated region of GAM1217 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM1217 target RNA into GAM1217 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM3461 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM3461 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM3461 target RNA into GAM3461 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM4557 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM4557 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM4557 target RNA into GAM4557 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM7636 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM7636 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM7636 target RNA into GAM7636 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7706 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7706 polynucleotide: GAM1217 target protein, GAM3461 target protein, GAM4557 target protein and GAM7636 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM1217, GAM3461, GAM4557 and GAM7636

GR7707 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7707(GR7707) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7707 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The

method by which GR7707 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7707 precursor DNA encodes GR7707 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7707 is located from position 93648456 to position 93648553 relative to chromosome chr9 on the `+` strand (chr is an abbreviation for chromosome).

GR7707 precursor RNA folds spatially, forming GR7707 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7707 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7707 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7707 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM337264 precursor RNA, GAM337265 precursor RNA and GAM337266 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337264 RNA, GAM337265 RNA and GAM337266 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337264 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337264 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337264 target RNA into GAM337264 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337265 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337265 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337265 target RNA into GAM337265 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337266 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an

untranslated region of GAM337266 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337266 target RNA into GAM337266 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7707 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7707 polynucleotide: GAM337264 target protein, GAM337265 target protein and GAM337266 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337264, GAM337265 and GAM337266

GR7708 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7708(GR7708) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7708 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7708 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7708 precursor DNA encodes GR7708 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7708 is located from position 106800362 to position 106800470 relative to chromosome chr9 on the `+` strand (chr is an abbreviation for chromosome).

GR7708 precursor RNA folds spatially, forming GR7708 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7708 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7708 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7708 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337390 precursor RNA and GAM337391 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337390 RNA and GAM337391 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337390 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337390 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337390 target RNA into GAM337390 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337391 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337391 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337391 target RNA into GAM337391 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7708 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7708 polynucleotide: GAM337390 target protein and GAM337391 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337390 and GAM337391

GR7709 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7709(GR7709) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7709 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7709 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7709 precursor DNA encodes GR7709 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7709 is located from position 117327121 to position 117327213 relative to chromosome chr9 on the `+` strand (chr is an abbreviation for chromosome).

GR7709 precursor RNA folds spatially, forming GR7709 folded precursor

RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7709 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7709 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7709 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337463 precursor RNA and GAM337464 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337463 RNA and GAM337464 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337463 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337463 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337463 target RNA into GAM337463 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337464 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337464 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337464 target RNA into GAM337464 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7709 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7709 polynucleotide: GAM337463 target protein and GAM337464 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337463 and GAM337464

GR7710 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7710(GR7710) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at

least one target gene, the function and utility of which at least one target gene is known in the art.

GR7710 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7710 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7710 precursor DNA encodes GR7710 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7710 is located from position 1124872 to position 1124968 relative to chromosome chrX on the `+` strand (chr is an abbreviation for chromosome).

GR7710 precursor RNA folds spatially, forming GR7710 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7710 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7710 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7710 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336253 precursor RNA and GAM336254 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336253 RNA and GAM336254 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336253 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336253 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336253 target RNA into GAM336253 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336254 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336254 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336254 target RNA into GAM336254

target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7710 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7710 polynucleotide: GAM336253 target protein and GAM336254 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336253 and GAM336254

GR7711 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7711(GR7711) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7711 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7711 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7711 precursor DNA encodes GR7711 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7711 is located from position 47243042 to position 47243138 relative to chromosome chrX on the `+` strand (chr is an abbreviation for chromosome).

GR7711 precursor RNA folds spatially, forming GR7711 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7711 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7711 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7711 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM3768 precursor RNA and GAM5422 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM3768 RNA and GAM5422 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM3768 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM3768 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM3768 target RNA into GAM3768 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM5422 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM5422 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM5422 target RNA into GAM5422 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7711 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7711 polynucleotide: GAM3768 target protein and GAM5422 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM3768 and GAM5422

GR7712 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7712(GR7712) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7712 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7712 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7712 precursor DNA encodes GR7712 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7712 is located from position 77528890 to position 77528959 relative to chromosome chrX on the `+` strand (chr is an abbreviation for chromosome).

GR7712 precursor RNA folds spatially, forming GR7712 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7712 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7712 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at

least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7712 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM4130 precursor RNA and GAM8439 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM4130 RNA and GAM8439 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM4130 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM4130 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM4130 target RNA into GAM4130 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM8439 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM8439 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM8439 target RNA into GAM8439 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7712 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7712 polynucleotide: GAM4130 target protein and GAM8439 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM4130 and GAM8439

GR7713 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7713(GR7713) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7713 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The

method by which GR7713 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7713 precursor DNA encodes GR7713 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7713 is located from position 94524959 to position 94525061 relative to chromosome chrX on the `+` strand (chr is an abbreviation for chromosome).

GR7713 precursor RNA folds spatially, forming GR7713 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7713 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7713 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7713 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM361 precursor RNA and GAM4707 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM361 RNA and GAM4707 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM361 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM361 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM361 target RNA into GAM361 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM4707 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM4707 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM4707 target RNA into GAM4707 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7713 polynucleotide correlate with, and may be deduced from, the identity of

the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7713 polynucleotide: GAM361 target protein and GAM4707 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM361 and GAM4707

GR7714 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7714(GR7714) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7714 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7714 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7714 precursor DNA encodes GR7714 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7714 is located from position 98459191 to position 98459278 relative to chromosome chrX on the `+` strand (chr is an abbreviation for chromosome).

GR7714 precursor RNA folds spatially, forming GR7714 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7714 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7714 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7714 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337303 precursor RNA and GAM337304 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337303 RNA and GAM337304 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337303 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337303 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to

a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337303 target RNA into GAM337303 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337304 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337304 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337304 target RNA into GAM337304 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7714 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7714 polynucleotide: GAM337303 target protein and GAM337304 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337303 and GAM337304

GR7715 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7715(GR7715) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7715 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7715 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7715 precursor DNA encodes GR7715 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7715 is located from position 107483900 to position 107487923 relative to chromosome chrX on the `+` strand (chr is an abbreviation for chromosome).

GR7715 precursor RNA folds spatially, forming GR7715 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7715 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7715 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7715 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate

GAM precursor RNAs, GAM5254 precursor RNA and GAM8339 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM5254 RNA and GAM8339 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM5254 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM5254 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM5254 target RNA into GAM5254 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM8339 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM8339 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM8339 target RNA into GAM8339 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7715 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7715 polynucleotide: GAM5254 target protein and GAM8339 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM5254 and GAM8339

GR7716 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7716(GR7716) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7716 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7716 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7716 precursor DNA encodes GR7716 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand

nucleotides long. Nucleotide sequence of GR7716 is located from position 148875142 to position 148876293 relative to chromosome chrX on the `+` strand (chr is an abbreviation for chromosome).

GR7716 precursor RNA folds spatially, forming GR7716 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7716 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7716 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7716 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 3 separate GAM precursor RNAs, GAM337600 precursor RNA, GAM337601 precursor RNA and GAM337602 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337600 RNA, GAM337601 RNA and GAM337602 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337600 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337600 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337600 target RNA into GAM337600 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337601 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337601 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337601 target RNA into GAM337601 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337602 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337602 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337602 target RNA into GAM337602 target protein, herein schematically represented by GAM1 TARGET PROTEIN through

GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7716 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7716 polynucleotide: GAM337600 target protein, GAM337601 target protein and GAM337602 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337600, GAM337601 and GAM337602

GR7717 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7717(GR7717) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7717 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7717 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7717 precursor DNA encodes GR7717 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7717 is located from position 10653601 to position 10653697 relative to chromosome chrX on the `-` strand (chr is an abbreviation for chromosome).

GR7717 precursor RNA folds spatially, forming GR7717 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7717 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7717 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7717 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336355 precursor RNA and GAM336356 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336355 RNA and GAM336356 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336355 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336355 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336355 target RNA into GAM336355 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336356 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336356 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336356 target RNA into GAM336356 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7717 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7717 polynucleotide: GAM336355 target protein and GAM336356 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336355 and GAM336356

GR7718 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7718(GR7718) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7718 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The method by which GR7718 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7718 precursor DNA encodes GR7718 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7718 is located from position 44431916 to position 44432023 relative to chromosome chrX on the `-` strand (chr is an abbreviation for chromosome).

GR7718 precursor RNA folds spatially, forming GR7718 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7718 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7718 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at

least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7718 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM336783 precursor RNA and GAM336784 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM336783 RNA and GAM336784 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM336783 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336783 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336783 target RNA into GAM336783 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM336784 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM336784 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM336784 target RNA into GAM336784 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7718 polynucleotide correlate with, and may be deduced from, the identity of the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7718 polynucleotide: GAM336783 target protein and GAM336784 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM336783 and GAM336784

GR7719 Fig. 16 further provides a conceptual description of novel bioinformatically detected regulatory polynucleotide, referred to here as Genomic Record 7719(GR7719) polynucleotide, which encodes an `operon-like` cluster of novel micro RNA-like oligonucleotides, each of which in turn modulates expression of at least one target gene, the function and utility of which at least one target gene is known in the art.

GR7719 precursor DNA, herein designated GR PRECURSOR DNA, is a novel bioinformatically detected regulatory, non protein coding polynucleotide. The

method by which GR7719 precursor DNA was detected is described hereinabove with additional reference to Figs. 8-18.

GR7719 precursor DNA encodes GR7719 precursor RNA, herein designated GR PRECURSOR RNA, an RNA molecule, typically several hundred to several thousand nucleotides long. Nucleotide sequence of GR7719 is located from position 122223589 to position 122223699 relative to chromosome chrX on the `-` strand (chr is an abbreviation for chromosome).

GR7719 precursor RNA folds spatially, forming GR7719 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA. It is appreciated that GR7719 folded precursor RNA comprises a plurality of what is known in the art as `hairpin` structures. These `hairpin` structures are due to the fact that the nucleotide sequence of GR7719 precursor RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial or accueate reverse-complement sequence of the second half thereof, as is well known in the art.

GR7719 folded precursor RNA, herein designated GR FOLDED PRECURSOR RNA, is naturally processed by cellular enzymatic activity into at least 2 separate GAM precursor RNAs, GAM337483 precursor RNA and GAM337484 precursor RNA,herein schematically represented by GAM1 FOLDED PRECURSOR RNA through GAM3 FOLDED PRECURSOR RNA, each of which GAM folded precursor RNAs being a hairpin shaped RNA segment, corresponding to GAM FOLDED PRECURSOR RNA of Fig.8.

The above mentioned GAM folded precursor RNAs are diced by DICER COMPLEX of Fig.8, yielding respective short RNA segments of about 22 nucleotides in length, GAM337483 RNA and GAM337484 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, each of which GAM RNAs corresponding to GAM RNA of Fig. 8.

GAM337483 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337483 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337483 target RNA into GAM337483 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

GAM337484 RNA, herein schematically represented by GAM1 RNA through GAM3 RNA, binds complementarily to a target binding site located in an untranslated region of GAM337484 target RNA, herein schematically represented by GAM1 TARGET RNA through GAM3 TARGET RNA, which target binding site corresponds to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig. 8, thereby inhibiting translation of GAM337484 target RNA into GAM337484 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN, both of Fig. 8.

It is appreciated that specific functions, and accordingly utilities, of GR7719 polynucleotide correlate with, and may be deduced from, the identity of

the target genes, which are inhibited by GAM RNAs comprised in the `operon-like` cluster of GR7719 polynucleotide: GAM337483 target protein and GAM337484 target protein, herein schematically represented by GAM1 TARGET PROTEIN through GAM3 TARGET PROTEIN. The function of these target genes is elaborated in Table 8, with references to GAM337483 and GAM337484
